Grind your axe somewhere else, Roland. You're starting to sound as "helpful" as Bill Cheek's detractors.

The guy didn't ask for a price, he asked for a phone number (which I've already given him, so I don't need to repeat it here).

>only $12.95.

As I've stated in the past, I wrote the "Scanner Master Upstate New York Guide". I agree that the NYC book's price is high, but that is the publisher's decision, not Warren Silverman's or anyone else's.

And by any objective standard, Scanner Master has far more local detail (and accuracy) than Police Call's edited dump of the FCC database. Others have already pointed out that the NYC/NJ region is covered by TWO volumes of Police Call, so the comparison price is twice what you keep quoting. (It might even be three books, if CT is not in the NY or NJ Police Call.)

I stand by my statements above, that each publication has value to particular hobbyists. If it's worth $40 to the purchaser, who are you to tell them it isn't?

>If enough people don't buy the Scannermaster guide, the price will come
>back down to earth ($20-$25.)

What really happens is that, if enough people don't buy any book, it goes out of print. Now that will REALLY help the hobby, I'm sure.

>
>If you can get ahold of a 2004 in good condition, GET IT.

Careful. Buying a 2004 is like playing with dynamite!

I bought a 2004 brand new, that I discovered had been already taken home by someone (the standard 2004 diode mods had been done). Within 6 months, problems associated with lousy solder joints and circuit board connections started cropping up. The radio went back to Tandy SIX times, and they never succeeded in solving the problems. I probably should have screamed to Tandy, and demanded a replacement 2005, but the problems would stay fixed for about six months, thus taking the radio out of warranty each time. Finally, I threw the damn thing up on the shelf, and bought a Bearcat.

This past week, I needed something to do, so I opened the 2004, and cooked all of the solder joints. I also attempted to solder components on both sides of the board. Many of the joints were just loaded with rosen, and boiled ferociously when heated.

This didn't solve the problem. Next step is to take the radio to someone who knows digital radio circuits. With the service manual, I hope to find the problem, and fix it for good.

On the quality side, the circuit board looks as if it was assembled by chimps, and the components look like they were originally made for cheap, Korean transistor radios. Displays have a reputation for losing their ability to shine in the dark, and membrane keyboardss don't last worth beans

Thanks to this radio, I have never bought another Radio Shack product.

I'd stay away from the 2004 unless you know someone who can vouch for the history of the unit.

Have the new RELM for sale. Received for Christmas. Shipped COD for $225.00.

6. Battery Packs for scanners. Just replace the guts!

Newsgroup: rec.radio.scanner
Date: 1997-01-01 00:00:00 UTC
From: jholt@ziplink.net
Message-ID: <5aeihn$10s@news.ziplink.net>
Source record: 213274

Why get ripped off buying solid battery packs for scanners?

When the pack that you own gets sick, call any one of the dealers that advertise batteries in QST. They can sell you high quality replacements for the sick nicads that live inside of the plastic pack.

A Bearcat 200XLT pack with Gates batteries runs around $16.

EH Yost sells them as does W&W Associates in NY.

You do need to be able to disassemble the pack, and have to have some skill with a soldering iron.

It is difficult not responding to the stupid things you say. Yes, these aircraft were first rolled out in the
'60s, but they are constantly being upgraded with the current technology. Are you dumb enough to think
that once an aircraft is introduced further improvements are never made? That's what the little letters are
after the number in an aircraft designation. Oh yes, I shouldn't have to tell you, you ARE THE EXPERT.

The newer cordless phones are 25 channels instead of the older 10
channels they go down in the freqs you stated. Go to my page to get the
complete list of corless frequencies.

This is an older AOR product...in good condition cosmetically...

Works good but the rechargeable batteries are shot, so I use it at home with an ac power pack, that could double as charger if you put good batteries in it..

It is a 20 channel scanner that covers the normal stuff, but does include cell and I suspect is old enuf that it is not locked out...honestly I never listen there, so don't know for sure...

I have no manual for it, but programming is straightforward.

I will ship in the US for $75.00.

Please e-mail if interested.

Then do we consider this a bug so to speak and not worth returning the
unit for? If they are all like this, I can live with it by simply not
changing priority for Channel 1.

Mike

I don't get it. If you find that 200 channels in 10 banks are
manageable, but 1000 channels in 10 banks are not, you could always
restrain yourself and use only 20 channels out of each bank. Voila!

Hi everyone I am new at this scannig thing a friend of min got me
hoooked on it and i want to make it a hobbie!!

I bought a bearcat SC150Y

How is that scanner?? is it anygood? can it be modified i mean
someone tell me something about it i need honest
advice??????????????????

what are ctcss tones????

Thanks everyone i really appretiate the help

I believe the 910ADL is a digital phone. It is not currently possible t
o scan these. I doubt that I would even care if I could ever decode one
of these because there are so many other cordless phones on the air that
aren't scrambled.

Tom

Anyone have a schematic for, or know where to get one for a Bearcat 220?
I have a 220 that seems to have a power supply problem...no display,
audio section produces hiss when volume turned up, but thats it. If you
have one that you can sell me, fax, e-mail as GIF, etc, etc, please
reply to GWORTH@IBM.NET Thanks for any help. George

Well, that's all nice and good, thanks for the spelling lesson, but you
didn't answer the man's question.

Altadena is on Dispatch 1 483.9875 with mobile 486.9875

Altadena L-Tac is L-tac 8, 483.1125

A-tac would be A-Tac 3 483.0125

Antenna is everything! Get you a good mobile magnet mount antenna and
you will notice a big difference.....you could buy a pre-amp but its
more trouble than its worth....if you have a intermod problem now (with
pager towers) you will be in big trouble with a pre-amp.
Just use a good antenna.

I hate to give radio shack and credit but they do sell a good scanner
antenna for $29.99
Catalog # 20-012 complete with coax...you will have to buy a pl259 to
BNC conector which they also sell for $3.49 catalog #278-120.

Happy scanning

Hi Steven,

You have got to find a better way to post to the NewsGroups. Having only two attached messages (no base message) and one in HTML is a lousy way to do it IMHO. Also use Follow-ups if you are going to post to so many NewsGroups all at once.

Or perhaps this is just another reason to dislike Micro$loth Internet News program :) .

Take care,

Michael (shotgun@best.com)

The Percon only lists what is in the FCC records. Interstitials, Itinerants, and mobile only licenses most often do not have a county listed. Also, most operations on Interstitial and Itinerant channels do not have licenses.

Monitor America and other ScannerMaster books rely not only on FCC files, but on actual listener reports and research as well. Many listings in ScannerMaster are the result of the authors direct research.

Percon's Spectrum is an indespensible tool for the serious scanner hobbiest, but it is not perfect, as any other resource is not perfect.

Wiggle the battery pack. Mine occasionally does this when the
battery/radio connectors (those little balls) to make quite properly.

Also, as the NiCds go bad, sometimes you have to plug in the charger to
turn it on. Kind of like "jump starting" it. All 3 batteries I've
replaced (in 9 1/2 years <G>) did this when they got marginal.

We here at the Wacko Free Wilderness Society are submitting the first draft of our charter.

What we are about. We simply want the freedom to go out to the woods, camp, fish, hike, and do whatever else we want to do in the wilderness without running into environmentalist wackos.

We at WFWS are committed to a world, one day, where our children can cut down trees when and where they want, provided they own the land. We want a wilderness where you can use a cellular phone without having an environmentalist jump out from the bushes, stomp on your phone, and throw pigs blood on you, all the while repeatdly screaming "Murderer!" A wilderness where you can walk through the trees without running into a sign clad wacko chained to a tree singing "We Shall Overcome".

We have taken no action as of yet, and are not soliciting members at this time. We do not condone illegal activities such as sniping wackos. We have taken no legal action, but may be forced to some day.

-Dave

I got a new scanner for Christmas, and I've been picking up local
cordless all the way from 43.100 up to 49.970MHz. They're supposed to
be between 46-47MHz, but these other freq's are not harmonics--it's the
actual signal.

46. Trunking in Australia

Newsgroup: rec.radio.scanner
Date: 1997-01-01 00:00:00 UTC
From: matthew@adelaide.DIALix.oz.au
Message-ID: <5acb48$rm9$1@adelaide.DIALix.oz.au>
Source record: 213324
Cross-posted to: rec.radio.scanner,alt.radio.scanner.uk,alt.radio.scanner

As there is a lot of talk about trunking Ill give all you all a bit of info on scanning/trunking in Australia. I think were very lucky here!

- There are NO laws except that it is illegal to listen to phone calls however scanners still cover the band. Ive heard a few others like not repeating what is heard but these are not confirmed.

- Our police throughout the major cities all use a conventional system which is very good for scanner users. So do our ambulance, fire etc etc. DVP is used on a few channels and that is rare.

- Here we have Motorola trunking 800mhz but this mainly has business users. So we dont have to deal with trunking problems yet.

- We also dont have a big range of scanners. We have the usuals like Uniden 120,220,3000,9000 and Tandy range and AOR 1500,1000,8000 but thats about it. (Except for special comms stores) Ive never heard of units like 890xlt, 135xlt etc etc etc.

I hope the above information gives an insight into scanning in Australia. The above is brief but that is really it. What more can I say except switch on and listen!

Cheers Matthew

Do you work for Scannermaster? Police Call give you more for your money. Why pay $40 (way over-priced) when you can get Police Call for only $12.95.

If enough people don't buy the Scannermaster guide, the price will come back down to earth ($20-$25.)

Source record: 213336

My BC200XLT is having problems after several years of faithful service.
Battery is good, unit suddenly refuses to turn on. On/off switch feels
normal, unit wasn't dropped nor abused. Any suggestions are greatly
appreciated. I'm hoping others may have experienced this problem and
found an easier fix than returning it to Uniden for repair.

[last changed 04-Sep-96]

The latest version of this file can be accessed via my web page at:
http://www.rdrop.com/users/billmc

FCC License Data Sources
Bill McFadden
bill.mcfadden@tek.com

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

| Also available are subscrition services from companies like ISI and CET.
| Since they charge by the minute, they are not really practical for the
| hobbyist and hence are not included in this list.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $104, and the mapping version is $174.

Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/ (WWW).

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. Regional CDs cover subsets of the US but come with a more powerful database manager and provide more detail about each license. Also available is a Ham callsign and repeater database CD.

Spectrum costs $37, and the Ham and Repeater Database is $22. Regional CDs are $137 for the first CD, $102 each additional CD ($560 for the entire 6 CD set). Data is updated twice a year. PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), support@perconcorp.com (email), or http://www.perconcorp.com (WWW). The Spectrum database can be searched free of charge via Percon's WWW page.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $10 per volume.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. The report includes a color plot with transmitter sites marked.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Reports are $26 each. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 708-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates makes a PC-based database program called the FCC
| Frequency Retrieval System. FCC data for several states is available,
| covering all services and all frequencies. More states are being added.
| Current data is for first quarter, 1996.

| News flash--this software and data is now FREE! However, the data will
| no longer be updated, so get it while it's hot. ScanWare Associates can
| be reached at 360-698-1383 (voice), 360-698-8207 (fax), gmcavoy@oz.net
| (e-mail), and http://www.oz.net/~gmcavoy/index.html (WWW).

US SCANNER PUBLICATIONS

Similar in style to Police Call, this series of directories covers ALL
radio services between 30 MHz and 2 GHz. Each volume covers one state
and costs between $14 and $29, depending on the state. The volume for
California is 820 pages. Contact US Scanner publications at 800-890-6999
(voice) or 503-233-5176 (fax).

APPENDIX

Here is table of data fields in the FCC master. Fields provided by
various products are indicated by "#" or the field length, if known.

Hi

I think you may be a little confused about what a CTCSS tone actually is. If the radio is set up correctly you should not be able to hear the CTCSS tones being transmitted. They are supposed to be SUB AUDIBLE. They are most useful when one or more users are sharing a base station site and don't want to hear each others communications, not so much for privacy but for the shear annoyance of hearing someone else. A scanner will pick up all the users on a communal base regardless of the CTCSS tones, however i
f you want to only monitor ONE of those users on the base site and you know their CTCSS tone then you can program your scanner to only let you hear the recovered audio when that SUB AUDIBLE tone is being received by the scanner as well.

Hope that helps

Michael

From: dragon@netshop.net
Message-ID: <5add2hfrk1@noc.van.hookup.net>
Source record: 213347

Does anyone out there know where I could get scematics on how to build a 46-49 mhz freq transmitter? I know that there are transmitters (baby monitors) already out there on the market, but I think it would be neat to build one. Just think.....you could have your expensive cd player playing music inside your house(transmitter beside stereo) and have your scanner beside you in your hottub (DC power of course. :)) listening to your favorite tunes...or you could switch back and forth..
that would be kind of neat eh?

Norm. B

70. BC3000XLT Help.

Newsgroup: rec.radio.scanner

From: mikeinglen@earthlink.net
Message-ID: <5adcf9$coj@guyana.earthlink.net>
Source record: 213348

Anyone with a BC3000XLT... I was wondering if there is something I don't understand, or if in fact I have a defective unit. When changing a Priority from one channel to another, say in bank 1 from channel 1 to channel 14 instead, I hear the two beeps, the Pri tag comes on in the LCD and the scanner channel numbers seem to start scanning, but the scanner seems locked to bank 1. Only the bank one number blinks. When I push scan it scans once but when it reaches bank 1 again, it seems to stop.there.

Is there some rule regarding changing Priority channels in bank one, or is this just a plain old defective unit? If I leave Bank on and channel one as the priority channel, all else is fine in all other banks. Am I going about it wrong, or is it a defective unit.

Thanks

Mike - mikeinglen@earthlink.net

What kind of outfit is "Premier Products International"? Are they
exclusively a mail order company? How long have they been in business?
Do they have a web site?
I ask a lot of questions don't I.
It's just that $80 for a DSS 900 MHZ seems too good to be true...
so it probably is.

A cellular telephone antenna is purpose built for the job. A mobile type designed for mounting through the metal bodywork would be good, then add a metal groundplane at least 4 inches diameter.

A 1/4wave groundplane with a vertical element 3 1/4 inches long would work too.

Brad.

: discovered this when I put a test meter to the contacts. When the
: coating wears off it's dead.
:
: > Anyone have suggestions?
: >(I know I can take it to RS for repair, but I'd like to try it
: >myself). Any ideas?
:
: You can try to order a replacement keypad and install it yourself
: but it might be tough to get in to do that. (not knowing your radio)
:
: You could let RS service it. That might be expensive. They might
: not have the part anymore. Who know.
:
: Maybe someone could give both of us a clue as to what the contacts
: are coated with!?!?!?!
:
: Good luck,
:
: Kelly

For a start you could try carefully dissassembling the keypad and
cleaning the contacts with cotton buds (Qtips) and alcohol. This helps
clean out the gunge that builds up and works well on membrane keypads
used on remote controls.

Hey, now there's a solution! However, I'd try a sample on something first.

I would have to assume this would be available at an automotive store?

>buttons on the keypad. I thought this was bad contacts and that all I'd
need
>to do would be to take it apart and clean it, but from what you are
>saying, the entire keypad has to be REPLACED??

Basically, yes.

The contact on the backside of the buttons are coated with something.

I made the mistake of cleaning the back side of my remote with alcohol.
This did not fix the bad key and ruined all the other keys. I became
aware at that time that the contacts had a coating. It wasn't until I
had a pocket translator on/off key go bad. I put a test meter to it
and couldn't get a reading. I tested other keys and they were fine. I
picked a working key and cleaned it with alcohol. It went dead.

A couple of people have made some suggestions. I'd be careful.
You might do some irreparable damage to the keypad. But it might
be worth a try.

Kelly

On early model BC-200XLT's you can remove a 10k chip resistor, R-215 located above the Uniden IC UC-1147. The chip is not labled R-215 but it is located above the "DEN" in UNIDEN on the IC. This will allow full 800 Mhz coverage.

>
>"Battery Master" real or ripoff ($19.99 reg $49.95) ?

Mostly ripoff. Standard alkalines that have been used very lightly can be "topped" off to extend their lifetime a little bit. But they are still primary cells and cannot do this for more than 5 cycles or so. Also the separator in single-use alkalines is thin, and recharging often makes them develop short-circuits due to zinc dendrites penetrating the separator.

>What is special about the Renewals?

They have structural and chemical enhancements to the standard alkaline formula that makes them more tolerant of recharging.

Greetings of the seasonal kind

I am in need of a schematic for a COBRA SR15, 100 channel handheld scanner. When I turn it on
the display lights, and it scans, and it stops on a busy channel. trouble is, there is no audio at all.
Neither in the speaker, or the earphone when it is plugged in. I also don't get the customary BEEP
when I push the front panel buttons.

Am more than willing to pay the copy and postage charges etc.

Regards
Reed

Andrew,
It would be helpful to tell us what price range you are
considering. Are you looking for a handheld, mobile or base?
The Sportcat runs $160 these days. The new RELM HS200
is in the $250 category neck-n-neck with the BC230XLT. In
this price range there is also the BC890XLT.
$350 will get you a BC3000XLT, Pro-26 or BC9000XLT. A
little more will buy the Pro-2042 or Pro-2045.
For $450 you could get an MVT-7100. In the $550 to $600
range are the MVT-7200 and AR8000.
The latest rigs available are the MVT-9000, Icom R-10
and hopefully soon, the Bearcat Trunk Tracker(BC235XLT?).
How's that for a selection? You'll also need to decide
whether you can get by with a dual-conversion radio or
would be better off with triple-conversion. Any requirements
for special features or number of channels?

->expect it to be digital and encrypted.
-> Cheers

Well true, but is'nt that the trick; challlenge; fun;(pick whichever you like)
of scanning? Finding that stray frequency that for whatever reason is
sometimes, or even often, not encrypted? Or having that frequency that always
seems to be DES suddenly come alive with an "in the clear" survielance?
Think that can't happen? It does, and can result from something as simple as
one agent working in the field, discovering that his or her radio is'nt
operating properly in the secure mode. They may be forced to transmit in the
clear so everyone can be heard.
So keep listening, you never know what you might hear.
Phil

> real weak as I'm approaching home. Also, what is the best antenna you
> can buy to attach to a vehicle?
>
> TimTim, You seem to be doing good if you can pickup town traffic at that
range. The repeater towers must be fairly high. Generally, a formula
for determining VHF and UHF range is the square root of the antenna hight
in feet times 1.25 equils distance in miles to radio horizon. You could
use a higer gain antenna. Or a antenna that is specially tuned to the
frequencies you want to pick up. Just do a search for ANTENNA SCANNER
RADIO and see what you get. The other way is to add a pre-amp. Cheapest
is a radio shack TV - Cable coax amp. Just get or make a DC power supply
to power it with. Hope this helps.

FWIW.....

In Canada (just north o' ya') it would only be "admissable evidence" if
one of the two parties on the phone were aware that the conversation
were being recorded. I suspect it's the same down your way. So to
answer your question. No.

In the Northeast Corridor, I believe Amtrak uses 160.92. Elsewhere, they
use the frequency of the host railroad over which the train is operating.

From: Peter Lascell <plascell@inmind.com>
Message-ID: <32CCA39E.3162@inmind.com>
Source record: 213144

Wilmington NC has a unique approch to informing the public about what is happening. Even thought they operate a conventional UHF radio system with a couple of channels, they allow the local cable TV operator to re-broadcast the live radio audio on the local government access channel as they run the arrest reports and those delinquient in child support, etc., across the screen.

By using the cable TV audio methode of broadcasting, they control the distribution to those who are AT HOME who may have interest in what is happening in their neighborhood.

If Wilmington was to switch to a trunked radio system the same approach could be used with a radio programmed to a specific talk group. This would still provide the same purpose by controlling propaganda; i.e. let the public know what is happening (or at lease make them think they know what is happening).

>My question is, what the heck is a frequency counter? There are always
>posts about them, but it's not mentioned in any of the FAQs I can
>find.

In very general terms, a Frequency Counter locks onto, and displays
the frequency of the strongest RF it is getting hit with within its
usable range.

It passes no audio, and doesn't tell you what is actually emitting the
RF.

Beyond that, various models have bells and whistles that enhance their
usefullness for certain needs. The units made by Opto are very
popular with scanner enthusiasts.

Mark

Thats not a bulb! It is backlighted with Electro Luminescence, which
works from 70v rms, 300hz AC. It slides in behind the LCD.
Now and then, there is an ad in the back of Popular Communication
selling those stirps.

>your favorite tunes...or you could switch back and forth..
>that would be kind of neat eh?

ohh ya that would be just great! first of all.. whats the point of
running the transmitter off a big stereo.. since the scanner gives off
a mono signal (that also sounds like crap) second.... scanners olny
have limited volume...third.... cost.. it would be cheaper to buy a
little stereo and put it by the hot tub.. it would be more cost
efficent.. and better sound.. and higher volume...
Sorry to destroy your idea..

I've noticed that the Spectrum CD suffers from many typographical errors.
Look for "Commmonwealth" (Pennsylvania) or "Pennslyvania".

I spoke with the folks at Spectrum and they claim it's the master file
data entry errors. So if you can't find it using correct spelling, try
alternative error spelling. It's a great resource, but "there's never
enough time to do it right, but always time to do it over. [sigh].

Take it easy,

Andy

126. Double discone antenna - any views?

Newsgroup: rec.radio.scanner
Date: 1997-01-02 00:00:00 UTC
From: Neil Soane <nsoane@pavilion.co.uk>
Message-ID: <01bbf8bd$55cc9980$6582f2c2@m3.mindscape.pavilion.co.uk>
Source record: 213154

Dear all,

I am thinking of upgrading my current home antenna from a single 'scanmaster' pole to a double discone. I have not read any reviews of these weird looking aerials but I am wondering if any of the very knowledgeable people on here have actually owned or have had some experience of this type of antenna?

I have heard that the gain is significantly better than a single discone and the frequency coverage is acceptable from 25 to 1500Mhz, is this true?

Any views either to this mailing list or directly to me would be appreciated.

Regards,

Neil

I have put up a web page containing frequencies and information regarding fire and EMS monitoring in Phoenix, AZ and surrounding communities. The address is:

http://www.public.asu.edu/~drice

This page contains frequencies and information (codes, unit types, assignments, etc.) for several fire departments. Also included are frequencies and information for several air and ground ambulance companies.

There are no police frequencies on this page because police information is readily available on several other web pages.

In my opinion, Scanner Master NYC edition is well worth the price. For
your money you get the detailed info you need to use to enjoy the
hobby. Specifically unit ID's. How could you sit by the scanner all day
listening to various numbers and codes without knowing what they mean?
("Unit 65-2 respond on a signal 6 code 3 at 1745 hours, 56-23")
Police Call in my opinion is just regurgitated stuff from the FCC, that
is quite repetitive. All those other numbers other than the freq,
callsign, and if it's base,mobile, or repeater are insignificant. Do I
care about the number of mobile radios out there? No. The only reason I
buy this book is to cross-reference. I look at it very rarely.
Menwhile, I refer to ScannerMaster daily if not hourly.

It shouldn't be much different than a Pro-43. Go to support.tandy.com
and get the part number for the keypad on line. Call 1-800-THE SHACK.
They will tell you 7-10 days to get there, but it will take about
three. You will only need to desolder the two connections on the
antenna and remove several screws. About 6 screws on the first PCB, 2
on the second, and 5 I think on the last board. Pull the old keyboard
out and pop in the new one. Just make sure that you leave the front of
the scanner facing down or the LCD display will fly out and may bounce
around on the floor.
If you are down that far you might as well just make the cell
mod if you haven't already. Put everything back together. Take you
time and dont pinch the wires putting it back. Make sure you solder
the antenna connections back or you will be scratching you head trying
to figure out where all the sensitivity went to.

I am interested in adding a decode feature to my recorder s/w but the
concern I have with this is: does it take a lot of CPU to listen to
samples for DTMF tones?

Would it be realistic to use an algorithm like FFT to perform the
decoding?

I recently purchased an RS2026 mobile scanner, and have mounted in it
my car, however I don't know how to hook it up to the electrical
system. I have an 86 BMW 325. Can someone take the time to explain
this seemingly simple task to me?

Thank you,

James Dunleavy

For someone with umm, 'attenuated' intellectual capacity, I suppose it is.

>Yes, these aircraft were first rolled out in the
> '60s, but they are constantly being upgraded with the current technology. Are you dumb enough to think
> that once an aircraft is introduced further improvements are never made? That's what the little letters are
> after the number in an aircraft designation. Oh yes, I shouldn't have to tell you, you ARE THE EXPERT.

I'm only an expert in the sense of comparatively-speaking. But my relative EXPERTise tells me that even P-3C's & the C-141Bs are not necessarily "state of the art," and that not all upgrades ('state of the art' or otherwise, and I am a little familiar with the P-3 'UPGRADE ##' programs) will include UHF blade antennas -- UHF AM/FM-SATCOM antenna systems, yes, but not necessarily your beloved & omnipotent UHF blades. Go look up how long ago the C versions of the Orions & the B versions of the Starlifters were introduced & then report back to me for further humbling & enlightenment, Grasshopper!

I'll give you some hints. I want you to do your own research, so the hints are designed so that you'll still have to work very hard to come up with the answers to your homework! You will need a calculator...

HINTS:

#1. First P-3 (prototype) flew in a year that ends with an even number, and falls between 1957 & 1959 A.D. [1]
#2. First P-3C entered service before 1970 A.D. [1]
#3. First C-141s upgraded to the current 'B' standard were delivered to

good old MAC after 1978 A.D. but before 1980 A.D. [2]
#4. Current year (at least in my space-time continuum) is 1997 A.D. Your comment about P-3Cs & C-141s (I'll assume you mean C-141Bs) being "state of the art" was also posted in my 1997 A.D. space-time continuum. If your space-time continuum currently has your intellectual plane residing in a different year, state the year (& whether B.C. A.D. STARDATE, or other) in your answers.
#5. Read the questions thoroughly, ask for clarification or reading assistance if necessary. Think carefully, take your time, and respond intelligibly in this forum.
#6. Write your full name at the bottom of your answer sheet.
#7. If the stress is too intense for you, by all means, completely ignore or selectively respond to this posting (unless you hear voices directing you otherwise)!

QUESTIONS:

#1. What year did the first P-3 prototype fly in?
#2. How many years ago (using your space-time continuum year or mine, state which) were P-3Cs introduced into the PATRON fleet?
#3. How many years ago (using your space-time continuum year or mine, state which) were C-141Bs introduced into USAF Airlift Squadrons?
#4. Would a B-52D be more "state of the art" than a B-2A?

BONUS QUESTIONS:

#1. Yes or no -- do you have a difficult time resisting the urge to respond to "stupid things" that I "say?"

#2. Yes or no -- do you hear other voices saying "stupid things" to you?

#3. Yes or no -- do you have access to any working firearms, explosive devices, or edged weapons?

Mark,
Here are the frequencies:

Channel Frequency
1 462.5625
2 462.5875
3 462.6125
4 462.6375
5 462.6625
6 462.6875
7 462.7125
8 467.5625
9 467.5875
10 467.6125
11 467.6375
12 467.6625
13 467.6875
14 467.7125
Good Luck
Doug Rotramel

147. Charger for Standard Alakaline Batteries

Newsgroup: rec.radio.scanner
Date: 1997-01-02 00:00:00 UTC
From: Gary Buchholz <avenger@mail.suba.com>
Message-ID: <32CB7E68.66DA@mail.suba.com>
Source record: 213239

The folks at Damark (1-800-729-9000) advertise "Battery Master" by
"Clearline Concepts"
supposedly capable of recharging both NiCad and standard Alakaline
Batteries.

To my knowlege the only rechargable Alkalines were the specially
formulated Renewals.

"Battery Master" real or ripoff ($19.99 reg $49.95) ?

What is special about the Renewals?

Thanks,
Gary / ke9zm

I'm afraid so. As the GSM cellular network is digital, all you will hear is the squeeks and squawks such as those when you pick up the telephone and the modem is still on. Our networks in South Africa work at 900 Mhz, but some overseas systems work on 800 Mhz.

The good ol' days of scanning is coming to an end as trunking systems and digital comms take over.

Dean,
We are already working on ways to decode digital signals on
phones. Dont phreat it. Soon we will have the ability to listen in on
Spread Spectrum/DIGITAL signals. SHHHHH, dont tell the folks at GTE!!!

151. How to Limit Search on BC-230XLT?

Newsgroup: rec.radio.scanner
Date: 1997-01-02 00:00:00 UTC
From: ddd3@atl.mindspring.com
Message-ID: <5ag4ub$ebd@camel1.mindspring.com>
Source record: 213243

I saw a BC-230XLT at store yesterday with no manual for $159. I was
thinking of buying it but cannot figure out how to do a limit search.
Does anybody know the key sequence to limit search on this unit?
It says on box it has 12 selectable scanning ranges (not sure)?
Anyway, after playing with it for awhile I could not get it to do a direct
search on any of the upper frequencies.

Is there a reset feature built in? Does anybody know the key sequence
to reset this unit? Can I obtain new manual from vender
if I purchased it. I now have a RS Pro- 51. Which is a better radio?
It is priced for $159 marked down from $239. It looks like a return unit.
Need to know as soon as possible. Thanks, Dennis

152. 2004 Backlit display

Newsgroup: rec.radio.scanner

I know this has come up many times before but I would like to fix the backlit display for my Pro 2004. If I remember correctly there were two ways to do this: replacing just the bulb which took expert soldering or replacing the whole front display which I'm not opposed to if it's not that expensive. What are the needed parts called.

Wow you guys are great.
The ASTF??? I had a good laugh. thanks.
The possibility of detection does exist due to spurious transmissions
emitting from the receivers local oscillator however, this task would
require more resources than any government agency / non gov. agency
would spend attempting to locate a cell phone ease-dropper. If they
don't want you to listen you wont listen ask the USSR. The momentary
speech of cell systems can be heard but is usually switching from
tranceiver to transceiver as the person moves through the radio
cellular network thus the term cellular or a communications network
devided into cells to permit many people using the same frequencies
without fighting the 1/2 watt power output of most portable cell
phones. Remember it is not a crime to check your receivers ability to
receive the cellular phone system frequencies, It is a crime to listen
for content.

Do you happen to know how long a time-slice is spent on each frequency?

If I remember correctly, phonemes (speech sounds) run from about 70 to almost 300 msec. Also, there are two very small inter phoneme silences of about 40 and 60 msec.

The shortest sound I could ever distinguish, un-aided, was 28 msec. Although with a visual cue (my cpu's interrupt level LED) I could detect down to 11 msec.

It seems that if the phone shifted freqs. in a predictable manner, you might be able to pick up the whole conversation. That is if you had a scanner that would scan fast enough.

It would seem that about a 50 msec burst would prevent anyone from even getting a hint of the conversation on one frequency. (50 msec would be about the length of the "A" sound in the word "AT").

Let's see. 50 msec is 20 times a second.... I know that the Probe software for the Optoscan 535 can do about 25 msec shifts (40+ channels/sec) at 9600 baud.

I hope this helps you a little, and maybe stirs your imagination a bit.

cheers,
H Higgins

Tandy stopped supporting the PRO-2004 with repair parts a couple of years ago. Unfortunately, the display illumination for the 2004 is produced by an electroluminescent panel (EL panel) of a very precise dimension. That EL panel is not available, and similar ones from other scanners are too small.

Your ONLY option at one time was really to just replace the EL Panel with a new one from Tandy National parts (800) 442-2425. Now you are basically S.O.L. with no good options unless you can find a basket case 2004 that someone is willing to sell cheap and salvage the EL panel from it.

You could call Tandy and see if you can rag them hard enough to restock their supply of the larger EL panels. I doubt they will take to a ragging, though, but if enough people do it.....??????

You could make do with a replacement EL panel from the PRO-2006 which is still available, albeit too small, and will look bad......bad looks won't hurt anything, though.

Or.....you can get creative and redesign the backlight altogether for something that is available and functional. An idea I have been mulling over is to get a frosted glass slide (like a microscope slide) of the same size as the EL Panel.....and behind it, mount a row of incandescent "grain of wheat" bulbs, or even a bank of green LEDs like what lights up the newer PRO-2035 and PRO-2042 now.

Or perhaps you can be even more inventive and conjure up something no one else has ever thought of.

Good luck.

NFM DISCRIMINATOR CHIPS - BASEBAND AUDIO - SQUELCH GATE DATA
==========

There is a growing interest in tapping the
baseband audio out of various scanners for
decoding of a variety of esoteric signals,
including CTCSS, SCA, FSK, RTTY, FAX, etc. By and
large, such signals cannot be take from TAPE REC
jacks, headphone jacks, and EXT SPEAKER jacks
because of the voice-band filtering that is done
between the signal source and these output jacks.

Therefore, it is necessary to tap the "baseband
audio" directly at the output of the discriminator
chip for your scanner. The below Table shows a
list of scanners, the discriminator chip(s) used
in the scanner, circuit symbols of those chips,
and three pins of general interest on the chips:
RF-Input, Scan Control, and, of course, the
baseband audio pin.

Even though your scanner may not be listed, if you
can find its discriminator chip, it will be listed
with one or more scanners below, the pins of which
will be the same for your unlisted scanner!
Corrections and additions to this list are
requested. See my mail and other addresses at the
end of this file.

UNIDEN SCANNERS and Realistics made by Uniden
==========

Uniden does their darndest to make it difficult to
hack their scanners. You guys have some work to
do. Here's the deal: Even though all NFM
discriminator chips have a SCAN CONTROL pin,
Uniden doesn't always use it! Some Uniden
scanners have a separate Squelch circuit with the
SCAN CONTROL pin on the discriminator unused! You
have to find the real Squelch circuit, and then
determine the Logic for that circuit. It's easy,
but differs from one scanner to the next, and I
can't cover them all. I need your help.

See Table 2 below for a good reference. By and
large, those with scanners of Uniden origin have
to tackle the preliminaries in this fashion:

1. Locate the NFM Discriminator chip - you will
find the Audio pin from Table 1. It remains valid.

2. Determine if the SCAN CONTROL pin on that chip
is used. (Follow its trace out on the PCB)

A. If so, then determine the logic order. If
the SCAN CONTROL pin is used, then we can
use it!

B. If the SCAN CONTROL pin is not used,
then locate the real Squelch circuit.
The schematic and block diagrams in
the service manual will be helpful.
Uniden uses chips like NJM2902,
NJM2904 & NJM3403 to generate Squelch
logic. Use your voltmeter to find a
spot where the Squelch logic is 0v and
5 or 8v, depending on the setting of
the Squelch control. Table 2 shows
details for those Uniden-made scanners
with which I am familiar.

TABLE 2
UNIDEN SQUELCH CHIPS

>Anybody got the HOKA decoding software to e-mail to me. I would like to try
>it before buying my own!!! A trade could be arranged.

Nice try!

At over $500 for the elementary version, you think it is "try before buy"
capable? Ri--ght. <smirk>

It's really....."try to get your money back after you buy" software. Maybe
they guarantee it; maybe they don't. Good luck on finding
"evaluation-ware", though.

The funny thing is that Microsoft Office 97 Professional costs less, and is
ultra-modern and ultra-productive all the way. Gosh, you can even get Corel
DRAW 7 for less than what HOKA soaks you. HOKA is funky DOS-ware last I
knew. <groan>

I am comtemplaing the purchase of a scanner for use while I travel in my car and would like to get an expert opinion on the model best suited for the intended use. I have been reading about the BCT7 and am wondering if this model is a good alternative to a radar detector. Actually, is any scanner a good alternative?

I also plan to use the scanner in my home for casual listening and I am sure that either of these scanners would do quite well. But would the BCT7 or BC150 be better for state highway patrol detection? Thank you.

No manual came with the unit?

There should be either two, or three power wires coming out of the back of the 2026. A red one & a black one for sure, and maybe an orange one. The red (& maybe orange) wire(s) should have a fuse.

I'm assuming your car's main power bus is the standard 12V negative ground type.

The black wire should be attached to a good ground -- a metal nut or bolt on your car that is directly or indirectly connected to the chassis. Don't just assume though that any nut/bolt/screw will provide a god ground. If you attach the power wires but the unit doesn't turn on, chances are your ground-wire hookup isn't making a good enough connection, or whatever you attached it to isn't a good ground.

The red (& orange) wire(s) should be connected to a 12V power source. Most convenient method is to just plug the wire(s) into a free fuse-panel slot. Choose on that is always energized (as opposed to one that only energizes when the ignition is on) & that way, you can use the scanner without having the key in the ignition.

Often the best method is to power the radio directly from your car battery. For you to do that, you'd probably have to extend the length of the 2026's power wires, & route them through the firewall into the engine block, etc.

But for someone not too familiar with all this stuff, and especially in the case of a little receiver like the 2026, I wouldn't bother with that.

Also, I'm not addressing issues like EMI/EMC that can come into play when choosing a power bus, because I know first-hand that you'll probably have enough problems with the 2026 if you're in an RF-dense environment like Chicago!

Dynamite can blow your head off. I never heard of the PRO-2004 doing
anything more than just crapping out.......... And the odds of a bad 2004
appear to be about one in twenty.....

The ironic thing is that the PRO-2004 is quite possibly the best overall
scanner of all time, despite a semblance of truth in what you related above.

Your information wasn't entirely correct, though. There is no "membrane
keyboard" - it's standard carbonized pad with conductive buttons. The

PRO-2004 was made by GRE-Japan, and you were one of the "lucky" ones to buy an early unit that came from a defective manufacturing process that escaped detection by Quality Control for a run of probably 5,000 units.

The PRO-2004 used all high-quality components, but the automated assembly process drifted at some point in the production run to where certain components were only partly stuffed onto the board. The wave soldering machine apparently had problems, too, maybe too low heat or maybe it was misadjusted for other parameters. In any case, wire lead components failed to get properly soldered....and lots of "vias" or plated-thru holes weren't fully soldered.

So there was a production run of increasingly lower quality PRO-2004's, and indeed, those units can take a lot of work to make right....and some are so bad they can't be made right.

In any case, this was not a "Radio Shack issue". RS only imported it. GRE made it. Sure RS gets the blame, but there is no relationship to the evolution of the line that became the PRO-2005, PRO-2006, PRO-2035, and now the PRO-2042. No matter what, you'll not find a comparable scanner anywhere else in the world.....all metal (shielded) case; large display; easy-to-use sloping tactile keypad; triple conversion/AGC-controlled/bandpass filtered/ doubly balanced mixers....etc, etc, all in one unit!

The PRO-2004 went on the market in September, 1986 and stayed for four years before it was replaced by the PRO-2005 in May of 1990. The PRO-2005 lasted only a year before it was replaced by the PRO-2006. All three are of the same basic electronic design, almost clones, with only minor electronic changes from one to the next. Physical changes are obvious, but the 2005/2006 package leaves much to be desired with respect to the 2004.

You got a raw deal.....as did maybe 5000 others, though many units were fixed under warranty and have been okay ever since. There were at least 95,000 other PRO-2004's produced during its four year life, and most of them are still functional and competitive today. Scanner technology really hasn't advanced much since September, 1986. Firmware has come a long way but that is a different story..........

Hopefully, what he/she was trying to say was a scanner that
was CTCSS capable. For under $500, there are several to
choose from. For the widest frequency coverage, you'll
want to check out the BC9000XLT and the new Pro-2045.

Best of luck!

Strong signals,
Rich

>
>Anyone who can shed light on this question has my thanks.

The RF scanner spectrum of 25 MHz - 1300 MHz involved three distinct technologies for one thing. For another, the allocated bandwidths and modes of modulation differ from one band to the next.

The more coverage you want, involved more technologies; enhanced design; more components; larger physical size;......results in higher cost. It is easy and cheap to make a fixed frequency receiver.....like a pager. But to make it tunable, programmable, and to cover a wide range of signal variables including wide spectrum,........is more costly.

Then there is another factor. You ain't gonna like it. The manufacturers make cheap funky scanners just so they can add a hunk of profit to the top of the line models. If they eliminated the cheezy models, the mid and top models could be cut in price by 25% or more.

It's an age-old syndrome that started back when the Arabs invented one, two, and three-humped camels to suit a variety of tastes. People perceived three humps to be worth more than one and two, so the price artificially skyrocketed on the three-humpers, despite the fact that a three-humper eats less and can go a greater distance at a whack for a single feeding and watering.

Now do you see?

:-)

Doing a Motorola protocol "Trunked receiver" is not that hard. Even implementing an algorithm to do the 'feed forward' error detection and correction with the "Rate 1/2 Convolutional Code" and then performing the "10 bit block Parity" ("Block code encoder (45,35) foreshortened to (37,27)") can be done on an 8 bit microprocessor. Those in-the-know know what I'm talking about. (Want the source code? - just kidding.)

>
>You don't know me from Adam of course but I'm as close to a verified
source
>as you're going to get I suppose... I'm one of the developers. I can
verify

I showed my product to a dozen or so folks at Ham-Com in Arlington Texas in 1993. This predates Uniden. I have witnesses. I like Ice Cream.

>that this scanner actually works and will be available soon, probably
>sometime in Feb. 97. The model number is BC235XLT. It looks just like
the

The hard part is doing all that 'bit de-interleaving', the data part is
a snap once you start seeing Hex data words coming across the screen as
traffic is occurring on the voice channels. On one of the local (Type
II)
systems you can even decode the date and time.
(And I don't work for Moto or any 2-way company.)

Gee, just as there are 'freq guides' published in every major city - so,
too
'call group guides' will become popular. Remember, you heard it here
first.

>> on a conversation and follow it? How is the unit going to know what

: Hello ever since MDPD went out I have been trying to find out some freqs
: to listen to. I now listen to Municipal which use to be with MDPD but
: they stayed back on the old freqs. I want to know if there are any other
: freqs in the Miami area not Broward that are pretty fun to listen please
: help me out here.

To the contrary, I find MDPD even more interesting to listen to since they made the switch. There is also (for the time being, anyway) Coral Gables, Hialeah & MD Fire to enjoy as well as some North Miami stuff on channels r1 & r2. You can also find good stuff on Miami Beach & Miami systems as well. Just last night Miami had a police officer shot, and that caused all kinds of good stuff to listen to.

Don't get too used to listening to Municipal however, it too will go out as soon as all of the units & depts on it get their new radios, most already have them and are similcasting on the old as well as the new system.

By the way, MDPD has added a new dispatch district on their radios called Carol City (station 9).

Greetings from the frozen state of Kansas!

Iï¿½m writing this on December 29th, and the expected high temperature today in the KC area will be 50 with sunny skies...depending on the weather. Yesterday after work I went for a run in a T-shirt and sweat pants. Not bad for this time of year, so Kansas isnï¿½t actually frozen, just well refrigerated.

First, Doyle had some questions about the 70 Mhz frequencies licensed to the state...are they used by KHP or KDOT or both? As far as I know both agencies do/have used them. Jim from Great Bend (see his info later in the article) listens to KHP cars on one of them in his area. Somewhere I have two old maps showing all the links for KHP and KDOT, and if I can scrounge them up Iï¿½ll try to send a copy to Doyle, or anyone else that wants them. I doubt that they are very accurate now, and with the coming of 800 Mhz they will surely be obsolete soon.
For what it is worth, KDOT used to have a UHF link by I-35 between Gardner and Olathe on 453.6375 for their low band system. I drove by it for several years without know what was on that 50ï¿½ tower. Eventually I figured it out. It seemed that when I was in the area of the tower some "bleed-over" would often appear on Prairie Villageï¿½s frequency of 453.625. I poked the search range of 453.600 to 453.700 in the 2006 and immediately found the frequency. Since I lived only a few miles away it was real handy for me. I could finally hear the mobile units.
The tower is empty now that KDOT is on 800 around here. Luckily for the state I am an honest individual...otherwise I would be tempted to turn a few bolts, let it fall and drag it home with my tractor!
Doyleï¿½s last comment was about the frequency of 453.450 licensed to KHP. That frequency is actually the Johnson County InterCity Radio System. Lenexa PD put the system in about 15 years ago with the idea that any Johnson County agency could use it for inter-agency traffic. Cars and dispatch centers alike were equipped with it. The cars for agencies that have gone 800 donï¿½t have it anymore. Police Call often shows it as an "inter-agency" or "inter-city" channel. It is simulcast on 460.100, too. Hope that clears that up, Doyle.

Bob from Tonganoxie told us in the December column of a surveillance frequency that popped up in Lawrence. That frequency is 856.7125, and consisted of simplex traffic. Seconds after I hit the "enter" button which shot the column over the internet, I received another e-mail from him with the final poop on the frequency. It is indeed Lawrence PD, but it was being used during a training exercise. Some of the tell-tale traffic included "Called all the 150 units in for lunch." Bob is going to continue to monitor it and keep us informed. Just because it was used for training one day doesnï¿½t mean it wonï¿½t be a surveillance

frequency the next, so keep it in the scanner.
In a later e-mail Bob noted that he ran across a new (?) Postal Inspector repeater. It is 414.750 used in the KC area along with the other repeater on 415.050. He wonders why they need 2 channels for this area...maybe one for KS and one for MO. Anybody have the answer?

Thanks again, Bob.

Jim from Great Bend has a quantity of info for this month.
Apparently Hoisington PD had been reported to use 453.100. This was the original plan, but it became overcrowded with city government traffic so the PD migrated to 460.600, which was the old Hoisington Fire channel. Where did Hoisington FD go? They are now dispatched by Barton County on 453.400...a previously unused frequency. The PD uses 453.150 as a car to car channel to avoid tying up the main repeater. This could get confusing, so here is a list:

453.100 Hoisington city
460.600 Hoisington PD
453.400 Hoisington FD/EMS
453.150 Hoisington PD car to car

I assume that Barton County deputies use 453.150, too, since it is a county frequency. Iï¿½ll get with Jim on that and confirm it one way or another.
He also noted that the statewide 800 system isnï¿½t up in the Great Bend area yet, and there is no real discussion of when it should appear. It will definitely come about someday, though. Jim is curious about what will happen to the 70 MHz and 400 MHz relays once 800 does take over. As far as I know, they will go away with the low band stuff. If you can currently monitor one of the relays, you know you can listen to cars from all over. With the 800 MHz system you can hear the cars from all over, as well as the dispatcher, so donï¿½t get too worried about loss of monitoring abilities. It should only get better.
Speaking of KHP, Jim hasnï¿½t been able to find what frequencies the KHP aircraft use now. Their use of low band has seemed to stop, and he has tried the VHF high band freqs used as an extender and a talk around channel. No luck. I spoke with the Troop A dispatcher and he said that he was unaware of any change in channel usage, but since the stateï¿½s budget has been slashed (sounds like something a politician would say,) the aircraft havenï¿½t been used much at all. That could account for the lack of traffic.
The last part of Jimï¿½s information deals with some traveling he did. His first stop was the Wichita area. Listening to their 800 system proved to be frustrating due to the large number of phone patches and car/car private conversations. The private conversations are initiated by one radio operator who keys in the 5 or 6 digit serial number of the other radio, and a private channel is automatically set up for those two. KHP was monitored on the city/county system, as well as on the 44.980 lowband system. The two are being simulcast. Jim figured that KHP does that so agencies without 800 monitoring equipment can hear what is going on. That

is exactly right. Also, there is the possibility of a Trooper from an area with no 800 equipment traveling to Wichita and needing to communicate. Thatï¿½s what the Troop A dispatcher said, anyway. Silent were the NPSPAC frequencies for that area, as well as the state licensed frequencies of 856-860.4875 and 9625.
McPherson was Jimï¿½s next destination, where he heard the county on the NPSPAC frequency 866.0750. That frequency transmitted data the entire 2 days he was there. Additional NPSPAC freqs monitored were 868.4500, 868.7875, 866.9750, 866.2125 and 866.9625. Nothing was heard on 866.3625, which is assigned to them as well. The three 866 MHz frequencies were not listed to McPherson county, but traffic was definitely heard. Some of the agencies on the system were Moundridge PD, McPherson CO EMS and SO, and possibly Lindsborg PD. This was all happening as he and his wife were driving. He claimed his wife didnï¿½t appreciate him poking buttons on radios instead of concentrating on driving, which resulted in numerous glares being shot his way. I donï¿½t know which is more distracting...reprogramming a scanner or getting hit with a .45 caliber glare. My wife once hit me with a dirty look that knocked me clear out of the reclining chair. She then finished me off with a couple sneers to the head. I digress...on with Jimï¿½s info. The system didnï¿½t seem to trunk much of the time, perhaps because of the limited amount of traffic. Does anyone have the answer to that? It had the 4 pesky beeps at the end of each transmission, too. The earmark of an Ericsson system. As far as I know, the beeps have no purpose other than to annoy us scan-heads.

Great information, Jim. Thanks!

A few weeks ago, a bi-state multi-city effort (sounds like another political phrase) made a step forward in providing weather information to the citizens of the Kansas City area. The Kansas City MO FD, the Mid American Regional Council, and the technical expertise of the Lenexa KS PD installed the Emergency Managerï¿½s Weather Information Network (EMWIN,) or Wireless Weather Information Network (WWIN,) as it used to be called. The National Weather Service transmits gobs of weather data via satellite to anyone with the rather expensive receiving equipment. With EMWIN, the data from the satellite is re-broadcast on 139.2125 from the top of Kansas City MOï¿½s city hall. The Sunday KC Star paper (12-29-96) has great story about it on the front page of the Metroppolitan section. The decoder and software sells for about $139. The data could probably be deciphered with a generic communications application, but you would have to figure out a way to filter out the data for all the areas in which you have no interest. The included software allows you to select what information you receive, plus lets you set "alarms" for things like tornado watches/warnings. It seems to be very versatile, and much more user friendly than the satellite system.
The only drawback I see is that the data is being sent 24 hours a day...meaning that your computer would be processing information ALL the time. Depending on your computer, that might present a problem. The system is designed for Emergency Management Offices and the like, who need to monitor the weather constantly. For us hobbyists, it might be best to invest in a cheapie used 386 to be used as a dedicated weather machine,

and free up our regular computer for important things...like solitaire and flight simulators.
Some of the selections one can pick or delete are:
Forecast A statewide forecast from each WX office in the state you choose.
Short Term A forecast done every 6 hours including current information.
Zone A forecast generally arranged by county or major metropolitan area.
Summary Recent weather patterns & conditions for the last several days.
Local Local forecast generated by each NWS office for that officeï¿½s area.
Rivers River levels in relation to flood stage, as well as scheduled water release from dams.
Travel Where available, travel info for inclement months.
Floods Indicates when there is a flood.
Radar The most recent radar.
Public Info Miscellaneous info.
Special Statements often sent to indicate the possibility of severe weather.
Temp Tables outlining temperatures, dew points, winds and pressure.
Aviation Stuff of interest to pilots.
County Info for selected counties.
Tï¿½Storm Warnings.
Tornado Warnings.
Winter Storm Warnings.
Severe WX Warnings of any severe weather.
Alarm Allows you to add or remove alarms.
Graphics are available, too. One can download several pictures of the same area at different times and "play" them back and see the movement of storms, etc. There is a lot more that this thing will do...trust me. (Now THAT sounds like a politician!)
You folks in areas where this isnï¿½t available yet ought to get with the local FD or Emergency Management people and have them chat with the NWS. Maybe you can get a system up in your part of the world. All you need is the satellite receiver and a VHF high band transmitter and you are on the air. If you are seriously interested, send a note Kevin Kay, who is listed below.

I'm going there this weekend, and would appreciate any info you have.
Please reply by e-mail to mstreger@ix.netcom.com. Thanks

184. Digital Cordless Phone Questions

Newsgroup: rec.radio.scanner
Date: 1997-01-02 00:00:00 UTC
From: fgk@iquest.net
Message-ID: <32cb07f3.2111757@news.iquest.net>
Source record: 213318

I have a Vtech VT-1900 digital cordless phone. The box does not mention spread spectrum, just "digital audio encryption" (whatever that is).

When I try to pick up the signal from this phone on my scanner, I find it to be spread out over a range of approximately 901.1 to 903.9 MHz. The signal is not there continuously across that range - but it is audible to varying degrees at the following frequencies:
901.075, 901.100, 901.4375, 901.4625, 901.6375, 901.6875, 902.125, 902.225, 902.2625, 902.3125, 902.3625, 902.4125, 902.5125, 902.600, 902.875, 903.1125, 903.775, 903.9375.
The clearest (and widest) frequency appears to be 902.6000.

If this is not a spread spectrum phone, then why is the signal spread over such a large range of frequencies? If I had a spread spectrum phone, what would be different? What advantages would there be to the spread spectrum phone?

Incidentally, I also tried placing an AM/SW radio with digital tuning near the phone to see if I could pick up any lower frequency signals. Sure enough, I pick up a signal at 1.520 MHz (and its harmonics). This is a somewhat distorted tone with frequency of around 1050Hz. I tend to suspect that the 1.5 MHz signal and the fact that the 900MHz transmission appears to be spread about 1.5 MHz from the center frequency (though not symetric) may be connected, but do not understand enough about how these phones work to figure out what it means.

If anyone has any comments about what I am hearing, or can answer my questions or point me to documentation, I would much appreciate your response in this newsgroup.

Thanks,
Frank Kienast

This device from Optoelectronics - What kind of price is there on
that?

Yea, I understand that There are some scanner control appications out
there already, but I am interested in writing some custom stuff - Fun,
Fun, Fun!

195. Pro-2035: pretty good deal

Newsgroup: rec.radio.scanner
Date: 1997-01-03 00:00:00 UTC
From: Pat & Adaire Mason <newlife@hula.net>
Message-ID: <32CD99B5.436D@hula.net>
Source record: 213079

Aloha y'all...

I just returned from an inter-island vacation on the Big Island
of Hawai`i and happened to see the 2035 (you know, the 25-1300 MHz
tabletop scanner with AM/NFM/WFM and 1000 channels) on sale for
$219.95, reduced from $499.95. Is this something that RS is
discontinuing? BTW, I bought one. The last one left in this
particular store (Kona Shopping Center, or something like that...
next door to Ross Dress4Less in Kailua-Kona) is the display.

Anyway, it's a lot of scanner for that price, if anyone is interested.
I like mine so far. Hey, for $220, ya can't beat it.

Anyone else know if this is going on in other RS's?

Cheers,

Pat Mason, AH6Z
newlife@hula.net
Mililani, Hawai`i

196. Major Bugging Frequencies 2 or 2

Newsgroup: rec.radio.scanner
Date: 1997-01-03 00:00:00 UTC
From: jmatk@tscm.com
Message-ID: <jmatk-ya023480000301972220290001@news.tiac.net>

Extremely High Threat Frequency Bands

50 - 750 KHz - Carrier Current Bugs (power lines or phone lines)

30 - 50 MHz - Ultra Low Power Bugs (microwatt devices)
65 - 130 MHz - Micro power Part 15 devices (FM broadcast band)
135 - 150 MHz - Body Wires and Wireless Microphones - Band I
150 - 174 MHz - Body Wires and Wireless Microphones - Band II
174 - 225 MHz - Body Wires and Wireless Microphones - Band III

295 - 310 MHz - Spread Spectrum and Micropowered Bugs (microwatt devices)

350 - 430 MHz Audio/Video Bugs (microwatt and spread spectrum devices)
430 - 550 MHz Audio/Video Bugs (434.xxx MHz popular)
890 - 960 MHz Audio/Video Bugs (902-950 MHz popular)

1.10 - 1.93 GHz Video and Audio
2.40 - 2.55 GHz Video and Audio (Extremely Popular)
6.20 - 7.50 GHz Video and Audio
8.10 - 13.00 GHz Video and Audio (Extremely Popular)

850 - 950nm Infrared Transmitters

Don't forget about the specific propagation and absorption bands:
(Bugging devices operating below 22GHz are very inexpensive, and easy
to buy. Devices operating between 22-60GHz are more expensive, but
just as easy to secure. Devices operating on frequencies above 60GHz
tend to be extremely expensive, and can be very difficult to obtain.

DC - 3 kHz Typical Audio Band
3 kHz - 700 kHz Skin Effect (Non Radiating)
700 kHz - 3 MHz Non Radiating, Conducted RF
3 MHz - 300 MHz Conducted RF, Free Space Radiating
300 MHz - 3 GHz Free Space Radiating RF, Slightly Directional
3 GHz - 22 GHz Free Space, Low Atten., Highly Directional
22 GHz - 60 Ghz Water Vapor Absorption Band (H2O)
60 Ghz - 3 Thz Limited Usage For Covert Surveillance

Note: the frequency area between DC and 22 GHz is heavily used for covert
eavesdropping, Major Realistic Threat area up to 60GHz. The 70-110GHz
M-band is also becoming very popular due to drastically reduced attenuation
between the oxygen peaks (at 60 and 125GHz)

Common Wireless Bugs (Low Power - Well under 35-50 mw)

44.500 - 51.000 MHz Baby and Room monitors (49.83, 49.845,
49.875, etc...)

72.100 - 75.400 MHz Hearing Assistance systems
54.000 - 150.000 MHz Kit Bugs

98.000 - 108.000 MHz Cheap out-of-band FM Bugs
112.000 - 142.000 MHz Cheap out-of-band FM Bugs
140.000 - 160.000 MHz Cheap out-of-band FM Bugs

60.000 - 320.000 MHz Low Cost kit bugs
398.000 - 406.000 MHz DECO Bugs (398.600/605, 399.450/455,
399.025/030, 406MHz)
25.000 - 450.000 MHz European/English Kit Bugs

150.000 - 216.000 MHz Typical VHF "Body Wire" & Pro-Grade Bugs
109.000 - 140.000 MHz Digital VHF Pro-Grade Bugs
138.000 - 174.000 MHz Typical "Spy Shop" & LE Cheap VHF Bugs
(155-172 Popular)
140.000 - 150.000 MHz Popular Xandi Flea power kits (143/144MHz)
150.000 - 170.000 MHz Popular Japanese Flea power kits (under 5mw)

150.000 - 220.000 MHz Commercial Wireless Microphones
169.000 - 172.000 MHz 47 CFR 90.265 Authorization *** VERY Popular ***
174.000 - 216.000 MHz 47 CFR 2.106 (NG115) Authorization
395.000 - 410.000 MHz German UHF Bugs (PK Electronics)
365.000 - 455.000 MHz English UHF Bugs (Lorraine/Ruby Electronics)
219.000 - 530.000 MHz English UHF Wireless Microphones (300-500
popular)
470.000 - 608.000 MHz Commercial Wireless Microphones
730.000 - 806.000 MHz Commercial Wireless Microphones

470.000 - 489.000 MHz Sony Bugs (2.5mw - 20mw, WFM, Ultra low power)
770.000 - 810.000 MHz Sony Bugs (2.5mw - 20mw, WFM, Ultra low power)
902.000 - 928.000 MHz Sony Bugs (2.5mw - 20mw, WFM, Ultra low power)
947.000 - 954.000 MHz Sony Bugs (2.5mw - 20mw, WFM, Ultra low power)

889.000 - 960.000 MHz Modified Cordless Phones (S/S & Hoppers)

380.000 - 480.000 MHz Video Bugs - US
430.000 - 900.000 MHz Popular US Video/Audio Bugging System

890.000 - 960.000 MHz Video Bugs - US (902-928 Hot)
905.000 - 928.000 MHz Video/Audio Consumer Products (i.e.: Recoton)

1.100 - 1.400 GHz Video Bugs *Very Hot in US/England/France/etc*
1.700 - 1.930 GHz Video Bugs - US
2.400 - 2.500 GHz Video Bugs - US *** VERY Popular ***
3.500 - 4.500 GHz Video Bugs *Very Hot in England/France/etc*
5.725 - 5.850 GHz Video Bugs - US *** VERY Popular ***
6.200 - 7.500 GHz Video Bugs - US *** VERY Popular ***

8.00 - 12.50 GHz X-band Audio/Video Bugs (Extremely Popular
w/ Gvt)
20.00 - 26.00 GHz K-band Audio/Video Bugs (Popular w/ Gvt)

Subcarrier Detection:

10 - 500 kHz - Most Commonly Used Subcarrier Bugging Frequencies

15 - 150 kHz - Typical Broadcast FM/TV Subcarriers (TV/FMSubC)
0 - 15 kHz - Typical Broadcast FM L+R Signal (Mono)
19 kHz - Typical Broadcast FM Subcarrier - Pilot
23 - 53 kHz - Typical Broadcast FM Subcarrier L-R Signal (Stereo, 38kHz center)
57 kHz - Typical Broadcast FM Subcarrier - RBDS/EAS
67 kHz - Typical Broadcast FM Subcarrier SCA/Musicast/Musak
92 kHz - Typical Broadcast FM Subcarrier SCA/Musicast/Musak

15 - 105 kHz - Typical Broadcast Television Subcarriers (TVSubC)
0 - 15 kHz - Typical Broadcast TV Audio L+R Signal (Mono)
15.75 kHz - Typical Broadcast TV Subcarrier - Pilot
31.50 kHz - Typical Broadcast TV Subcarrier L-R Signal (Stereo)
62.94 kHz - Typical Broadcast TV Subcarrier - SAP Secondary Audio
102.27 kHz - Typical Broadcast TV Subcarrier - Cue Channel

2 - 10 MHz - Typical Video Component Subcarriers (4.2-8 MHz common)

5kHz - 750kHz - Realistic Subcarrier Threat (Audio)
5kHz - 15 MHz - Realistic Subcarrier Threat (Video)

"Tactical" Bugs

225 - 400 MHz "Throw away" bugs (10uw-300mw Beer can bugs)
290 - 330 MHz Micro-powered Bugs (5uw-10mw Cigarette Butt Bugs)

30 - 500 MHz Tactical Repeaters (75mw-300mw)
285 - 400 MHz Tactical Repeaters (50mw-10watts)
100 - 152 MHz VHF Tactical Repeaters (300mw-25watts)
135 - 174 MHz VHF Tactical Repeaters (300mw-25watts)

VLF and Carrier Current Type Bugs

9kHz - 490 kHz Carrier Current 47 CFR 15.219 Auth (250 mv max.)
490kHz - 1.705 MHz Lossy Cable 47 CFR 15.221 Auth (1000 mv max.)
450kHz - 30.00 MHz PLA Systems 47 CFR 15.207 Auth (30 mv@ft/30ft max.)

3 - 200 kHz 300 mw High Grade Pro Bugs (over 500$ each)
100 - 200 kHz 50-100 mw Older Bugs
120 - 200 kHz 30-50 mw Pre 1990 intercoms
200 - 300 kHz 30-50 mw Post 1990 intercoms
300 - 400 kHz 250-450 mw TELCO Line transmitters (355kHz popular)

300Hz - 30 kHz Cable TV Carrier - Hardwired Microphones (Baseband Audio)
30kHz -300 kHz Cable TV Carrier - Coaxial Bugs (Wideband Audio/Video)

100 - 450 kHz Threat Window #1 Most CC Bugs
3kHz - 3 MHz Threat Window #2 Expensive "Pro-Grade" Bugs
5kHz - 32 MHz Threat Window #3 Popular WJ Carrier Current Rcvr
3kHz - 50 MHz Threat Window #4 Realistic Threat Window for Telephone Wire
15MHz - 70 MHz Threat Window #5 Audio/Video "Micro-Wire" RF circuits

WECO Bugs "boosted/ultrasonic audio" found on Power/CATV/Telco lines

64kbps to 1.5mbps Digital Bugs T-Carrier-Lo (T-1 and Below)
1.5mbps to 50mbps Digital Bugs T-Carrier-Hi (T-1 and above)
2.048mbps Digital Bugs Definity Circuit Pack Bug
32mbps Digital Bugs TMS Channel/Backplane bridge
Designed to transmit on QAM on Microwave Spread Spectrum (2.4-9.0GHz)

VLF Devices

25kHz - 90kHz Tape Recorder Bias Osc-Low End (35-45kHz Common)
80kHz - 145kHz Tape Recorder Bias Osc-Mid Range (88.2, 96, 100kHz Common)
100kHz - 325kHz Tape Recorder Bias Osc-Pro Grade (100, 150, 300kHz Common)
40kHz - 50kHz Tape Recorder DAT/Hi8 (44.1/48kHz Common)

4kHz - 35kHz Recorder Audio Servo Noise (10-20kHz Common)

7kHz - 35kHz Video Camera VLF Detectable emmisions
15.750 MHz Common NTSC Video Camera
15.734 MHz CCD/PCB Video Camera (very easy to detect)
15.625 MHz Common Video Camera

Also, be aware of ultrasonic/audio emmisions from most VLF devices.
(Utilize a EOD/Bomb Tech Stethoscope, and/or Ultrasonic Spectrum Analyser)

Commonly Used Law Enforcement Bugging Frequencies

37.000 - 952 MHz FCC Surveillance Blanket Authorization

47 CFR 90.19 "Physical surveillance, stakeouts, raids..."
Straight AM/FM/WFM, FM-Subcarrier, SSB, QAM, Spread Spectrum, and Hoppers.
If encrypted, it usually uses in-band voice inversion or 56 bit DES.
(Normally well under 2 watts... most below 35-150mw)

9kHz - 490 kHz Carrier Current 47 CFR 15.219 Auth (250 mv max.)
490kHz - 1.705 MHz Lossy Cable 47 CFR 15.221 Auth (1000 mv max.)
450kHz - 30.00 MHz PLA Systems 47 CFR 15.207 Auth (30 mv@ft/30ft max.)

25 - 50 MHz "Bumper Beepers" (38 - 47 MHz very popular)
135 - 170 MHz "Bumper Beepers" (150 - 170 MHz very popular)
450 - 512 MHz "Bumper Beepers"
903 - 904 MHz "Bumper Beepers"
904 - 912 MHz "Bumper Beepers"
918 - 926 MHz "Bumper Beepers"
926 - 927 MHz "Bumper Beepers"

148 - 174 MHz Wireless Microphone
135 - 250 MHz Out-band Wireless Microphone
174 - 216 MHz In-band Wireless Microphone
350 - 440 MHz Common Video Freqs
380 - 930 MHz Wide Band Hoppers
806 - 824 MHz Wireless Microphone
851 - 869 MHz Wireless Microphone
905 - 930 MHz Popular Audio/Video Band

1.1 - 1.3 GHz Common Video Freqs
1.4 - 1.5 GHz Common Video Freqs

1.7 - 1.9 GHz Common Video Freqs (1.710 - 1.755 REAL Popular at 1/10 watt)
2.4 - 2.5 GHz Common Video Freqs (2.400 - 2.450 REAL Popular)
5.7 - 5.9 GHz Common Video Freqs (5.725 - 5.850 REAL Popular)
8.5 - 10.8 GHz Common Video Freqs

AID - Westinghouse/Audio Intelligence Devices, Inc. Bug Freqs
135 MHz - 150 MHz Special Order/Secondary Band
150 MHz - 174 MHz Standard/Primary Band (Most Popular)
216 MHz - 220 MHz Special Order
400 MHz - 470 MHz UHF Repeaters

36 MHz - 39 MHz Very Low Power WFM (.5mw - 50mw) ***Very Dangerous***
80 kHz - 200 kHz "Line Carrier" Microphone Systems ***Very Dangerous***
30 kHz - 700 kHz Spread Spectrum Current Carrier Devices

1700MHz - 1900MHz 25-250mw Video and audio bugs (Mostly DEA/DOJ stuff)
2400MHz - 2484MHz 25-250mw Video and audio bugs

If the signal is "scrambled" it is nothing more than simple voice inversion,
a circuit to "de-scramble" costs around $20.

Note: AID devices are often re-tuned for outband channels... so be careful.

The area of spectrum from 30MHz to 500MHz is the primary threat, 500MHz to 3GHz
is the secondary threat, a "line carrier" threat is from 30kHz to 750kHz.

If the person planting the bug suspects that a TSCM inspection may be
conducted then AID suggests a frequency between 30MHz to 50MHz,
sensitivity of rcvr should be better than .18uv/-122dbm. The mode is
usually wideband FM.

Also, keep in mind that AID devices are frequently used for illegal buggings,
so be familiar with what their realistic specs are, expect power outputs
well under 50mw, and expect to see the AC power circuits being used as the
antenna.

Security Research Bugs - England
145 MHz - 175 MHz FAST-II-L Computer Bug - 1, 3, 10, 30, 100mw
170 MHz - 204 MHz FAST-II-H Computer Bug - 1, 3, 10, 30, 100mw

60 kHz - 200 kHz "Line Carrier" Microphone Systems ***Very Dangerous***

1.1 GHz - 1.4 GHz 250mw Lynx Video/Audio Bugs (L-Band)
2.5 GHz - 2.6 GHz 250mw Lynx Video/Audio Bugs
3.8 GHz - 4.2 GHz 250mw Lynx Video/Audio Bugs

Note1: LYNX video bugs and cameras are frequently built into old bricks, wooden
joists, logs, gate posts and such... VERY, VERY Dangerous and easily concealed.

Note2: Most Security Research Bugs utilize fixed frequency inversion to protect
against detection, a commonly used frequency is a 1.862kHz inversion point.

HDS - Household Data Services
50.000 - 750.000 kHz Carrier Current Audio System
120.000 - 400.000 kHz Carrier Current Audio System

138.000 - 174.000 MHz Wireless microphone/Body Wires (8KR Series .1 to 30 mw)
150.000 - 174.000 MHz Wireless microphone/Body Wires (ATX Series .1 to 30 mw)
174.000 - 230.000 MHz Wireless microphone/Body Wires
350.000 - 440.000 MHz Audio/Video Transmitters (360-440 popular)
470.000 - 608.000 MHz Audio/Video Transmitters
570.000 - 928.000 MHz Audio/Video Transmitters (Spread Spectrum Popular)
1,000 - 1,500 GHz Low Power Audio/Video Transmitter (10-100mw max)
1,425 - 1,450 GHz Low Power Audio/Video Transmitter (10-100mw max)
1,700 - 2,700 GHz Audio/Video Transmitters 2.4-2.5 hot (10-100mw max)
1,710 - 1,900 GHz Audio/Video Transmitters (10-100mw max) ** HOT **
6,425 - 7,125 GHz Low Power Audio/Video Transmitter (10-100mw max)
8,100 - 8,700 GHz Audio/Video Transmitter, 8.2/8.5 popular (10-100mw max)
10,200 - 10,700 GHz Audio/Video Transmitter, 10.5 popular (10-100mw max)
17,700 - 19,700 GHz Low Power Audio/Video Transmitter (10-100mw max)
21,200 - 23,600 GHz Low Power Audio/Video Transmitter (10-100mw max)

Sony - Wireless Microphones and Body Wires
470.000 - 489.000 MHz 2.5mw - 20mw, WFM (110khz), Ultra low power
770.000 - 782.000 MHz 2.5mw/10mw, Ultra low power - Chnl 64
782.000 - 794.000 MHz 2.5mw/10mw, Ultra low power - Chnl 66
794.000 - 806.000 MHz 2.5mw/10mw, Ultra low power - Chnl 68
770.000 - 810.000 MHz 2.5mw - 20mw, WFM (110khz), Ultra low power
902.000 - 928.000 MHz 2.5mw - 20mw, WFM (110khz), Ultra low power
947.000 - 954.000 MHz 2.5mw - 20mw, WFM (110khz), Ultra low power
60.000 - 970.000 MHz 2.5mw - 10mw, WFM (300khz) Audio Transmitter

Lorraine Electronics Surveillance
365.000 - 455.000 MHz Low Power NF Audio Transmitter

SKS - Skaggs Telecommunicatios Service
170.000 - 216.000 MHz Low Power Audio Transmitter/Body Wire

Swintek
136.000 - 150.000 MHz Wireless microphone/Body Wires (Special Order)
150.000 - 174.000 MHz Wireless microphone/Body Wires (Standard)
170.000 - 220.000 MHz Wireless microphone/Body Wires (Special Order)
200.000 - 470.000 MHz Wireless microphone/Body Wires (Special Order)

Broadcast Microwave Services
1.990 - 2.5000 GHz S-band Video Transmitters (under 100mw)
6.400 - 7.2000 GHz Video Transmitters (under 5mw)
6.785 - 7.1250 GHz Video Transmitters (under 10mw)
1.400 - 8.5000 GHz Video Transmitters (under 10mw)
12.700 - 13.2500 GHz Video Transmitters (under 10mw)
1.000 - 13.0000 GHz Video Transmitters (under 5mw)

Xandi Electronics
143.500 - Low Power Kit Bug (130 - 160 w/mod) Part 15 device
88.000 - 108.000 MHz Low Power Kit Bug (70 - 120 w/mod) Part 15 device

DECO
398.600 - Low Power Kit Bugs - Part 15 device

399.450 - Low Power Kit Bugs - Part 15 device
399.030 - Low Power Kit Bugs - Part 15 device
406.000 - Low Power Kit Bugs - Part 15 device
365.000 - 420.000 MHz Low Power Kit Bugs

Sheffield Electronics - No longer made
70.000 - 119.000 MHz Surveillance Transmitter Kits (under .1 - 10mw)
145.000 - 180.000 MHz Surveillance Transmitter Kits (under .1 - 10mw)
160.000 - 240.000 MHz Surveillance Transmitter Kits (under .1 - 10mw)
235.000 - 305.000 MHz Surveillance Transmitter Kits (under .1 - 10mw)

Vega
150.000 - 216.000 MHz Wireless microphone/Body Wires (Dynex, VX, T, etc...)
169.000 - 216.000 MHz Wireless microphone/Body Wires (Dynex, VX, T, etc...)

HM Electronics
160.000 - 174.000 MHz Wireless microphone/Body Wires (Sys 50/55, below 50mw)
174.000 - 216.000 MHz Wireless microphone/Body Wires (Sys 50/55, below 50mw)

Sennheiser
165.000 - 216.000 MHz Wireless microphone/Body Wires (SK Series)
770.000 - 810.000 MHz Wireless microphone/Body Wires

Telex
62.100 - 85.400 MHz Soundmate Products (Commonly Modified)
135.000 - 150.000 MHz Wireless microphone/Body Wires (WT Series)
150.000 - 165.000 MHz Wireless microphone/Body Wires (WT Series)
165.000 - 185.000 MHz Wireless microphone/Body Wires (WT Series) * HOT *
185.000 - 205.000 MHz Wireless microphone/Body Wires (WT Series)
165.000 - 210.000 MHz Wireless microphone/Body Wires (B/H/WT/G Series 30-50mw)
169.000 - 235.000 MHz Wireless microphone/Body Wires (FMR/HT/WT Series
35-50mw)
205.000 - 220.000 MHz Wireless microphone/Body Wires (WT Series)
450.000 - 470.000 MHz Wireless microphone/Body Wires (WT-450, below 50mw)
524.000 - 608.000 MHz Micropak Transmitter/Body Wires (35-50mw nominal)
518.000 - 760.000 MHz Micropak Transmitter/Body Wires (566-675 MHz popular)
614.000 - 746.000 MHz Micropak Transmitter/Body Wires (35-50mw nominal)
450.000 - 820.000 MHz Micropak Transmitter/Body Wires (15-35mw nominal)

Samson
135.000 - 220.000 MHz Wireless microphone/Body Wires (Poor Quality Products)

Electrosonics, Inc.
150.000 - 216.000 MHz Wireless microphone/Body Wires

Lectrosonics, Inc.
135.000 - 174.000 MHz Wireless microphone/Body Wires (50mw max)
174.000 - 216.000 MHz Wireless microphone/Body Wires (50mw max)
470.000 - 608.000 MHz Wireless microphone/Body Wires (70mw max)

Nady Systems
135.000 - 220.000 MHz Wireless microphone/Body Wires (VR series)
170.000 - 218.000 MHz Wireless microphone/Body Wires (VR series)

945.000 - 955.000 MHz Wireless microphone/Body Wires (VR series)

Electro Voice
135.000 - 220.000 MHz Wireless microphone/Body Wires (GS/MS Series)
169.000 - 216.000 MHz Wireless microphone/Body Wires (MB Series)

Shure Brothers
135.000 - 173.000 MHz Wireless microphone/Body Wires (171.845 popular)
160.000 - 216.000 MHz Wireless microphone/Body Wires (171.845 popular)
173.000 - 216.000 MHz Wireless microphone/Body Wires (below 25mw)
173.000 - 220.000 MHz Wireless microphone/Body Wires (L2 Series below 50mw)

Microwave Radio Corporation
1,700 - 2,700 GHz Low Power (3w - 42 chnls) Audio/Video Transmitter
6,425 - 7,125 GHz Low Power (1.5w - 30 chnls) Audio/Video Transmitter
17,700 - 19,700 GHz Video Transmitter - Broadcast Quality
21,200 - 23,600 GHz Video Transmitter - Broadcast Quality

Phonak - Switzerland
130.000 - 240.000 MHz MicroEar - In the ear FM-NB rcvr system
138.000 - 190.000 MHz MicroEar - In the ear FM-NB rcvr system
190.000 - 220.000 MHz MicroEar - In the ear FM-NB rcvr system

Electra Enterprises
434.000 - 435.000 MHz Video Transmitter (40-80mw nominal)
900.000 - 915.000 MHz Video Transmitter (40-80mw nominal)
(Also, Television Channels 32,46,47,48,49 59, and 900 Mhz)

Recoton
912.000 - 915.000 MHz Popular Audio/Video Transmitters (914 MHzpopular)
915.000 - 920.000 MHz Popular Audio/Video Transmitters (ultra low power)
902.000 - 928.000 MHz Popular Audio/Video Transmitters (ultra low power)

X10/BSR
290.000 - 305.000 MHz Transmits RF over AC power lines - Audio (301-303 hot)
301.000 - 315.500 MHz Transmits RF over AC power lines - Audio (310/312 hot)
410.000 - 426.000 MHz Transmits RF over AC power lines - Audio (418 hot)

Good Mind Industries - Taiwan
60.000 - 72.500 MHz Ultra Low Power Video/Audio Transmitter

Phonex
2.000 - 7.500 MHz Modified AC Mains Xmitter (-40 dBmv at 50 ohms)
2.620 - 6.400 MHz AC Mains Xmitter
5.500 - 7.000 MHz Wireless Phone Extender System (Sold at Radio Shack)

Radio Shack
120.00 - 200.00 kHz FM Wireless Intercom Systems (uses AC mains) -
Older Units
200.00 - 270.00 kHz FM Wireless Intercom Systems (uses AC mains)
300.00 - 400.00 kHz FM Wireless Intercom Systems (uses Phone wires, 355
popular)
35.00 - 50.00 MHz FM Microphones (49.830, 49.855, 49.890, 37.600 Popular)

75.00 - 110.00 MHz Tie-Tack Microphones (FM Broadcast Band)
50.00 - 290.00 MHz FM Microphones (CM-421, below 5-50mw)
160.00 - 230.00 MHz FM Microphones (169-176 popular, 5-50mw max, 15mw typical)
700-950nm Infrared Audio Transmitter (150khz carrier typical)

Various
1.500 - 9.000 MHz Phone Extender Systems
15.000 - 75.000 MHz Micro-Wire Conducted RF Systems (under 10mw)

LOJACK Corporation
173.075 - LOJACK Auto tracking system beacon (200ms burst every second) (This is the tracking device remotely activated via FM Sub Carrier)

Police Speed Enforcement Radar
10.450 - 10.600 GHz X-Band
11.488 - 11.628 GHz RD Detector
22.976 - 23.256 GHz RD Detector-2nd Harmonic
24.050 - 24.250 GHz K-Band
33.400 - 36.000 GHz Ka-Band
700nm - 1100nm Laser Threat

Electronic Article Surveillance and Anti-Shoplifting Systems
8.10MHz - 9.30MHz Checkpoint (Hi-Q Tags) 8.2MHz Common
57.75kHz - 58.75kHz Sensormatic (Magnetic) Books, CDs, and Tapes
915MHz and 1830MHz Knogo (Microwave Resonant) Adhesive Labels

Metal Detectors
5 kHz - 210 kHz Walk Through and Handheld Units (IE: Garrett)

WARNING:
The area between 600 MHz and 8 GHz is EXTREMELY DANGEROUS as the eavesdropping equipment in that range is inexpensive, low power, and highly directional.

Additionally, most TSCM people tend not to check frequencies above 1 GHz or 3 GHz (because the equipment is too expensive for them to buy).

I have surveillance video tapes of a TSCM inspection where the video cameras (Watec), microphones (Sony), and multiple microwave RF transmitters (2.4GHz) were never detected by the inspector (using 1GHz AVCOM and IFR Spectrum Analyzers). The person doing the TSCM inspection was a "surveillance expert" in the Washington DC area (his company is an inside joke within the TSCM industry).

Surveillance Satellite Frequencies
Note: Mostly Wideband Spread Spectrum/LPI channels

220MHz - 450MHz
1.2GHz - 1.4GHz
1.7GHz - 1.9GHz (1.76-1.84 active)
1.9GHz - 2.2GHz (2.115 active)

4.9GHz - 5.0GHz
5.5GHz - 8.73GHz
10.6GHz - 12.8GHz (11.7-12.2 active)
17.8GHz - 22.5GHz (Low Orbit SIGINT/IMINT Birds)

23.6GHz - 24.0GHz (Low Orbit SIGINT/IMINT Birds)
25.5GHz - 25.7GHz (Low Orbit SIGINT/IMINT Birds)
22.8GHz - 33.5GHz (SIGINT Birds)
42.5GHz - 47.0GHz (High Orbit SIGINT/IMINT Birds)
50.3GHz - 52.4GHz (High Orbit SIGINT/IMINT Birds)
78.0GHz - 85.5GHz (High Orbit SIGINT/IMINT Birds)
86.3GHz - 98.3GHz (High Orbit SIGINT/IMINT Birds)

also, 95 - 275GHz is used for government surveillance applications and operations, however; the usage is fairly limited.

Note: Surveillance satellite can be anywhere between 200MHz and 325GHz, mostly spread spectrum.

Commonly Used by Federal Agencies for Bugs, Wireless Microphones, and Body Wires (also 138-220MHz, 350-420MHz, and 1-13GHz, under 5-50 mw).

960-1215MHz Spread Spectrum Systems (Wideband)

8-13GHz Very popular for wideband, low power (under 10-100mw) video and audio devices

Generally Recognized Federal Bug/Spy Bands

Primary - 25-75MHz, 135-175MHz, 225-440MHz, 1.71-1.95GHz, 8.3-12.5GHz
Secondary - 890MHz-5.50GHz, 7.0-13GHz, 10-39.6GHz

Also, Wide Band Frequency Hopping centered on various UHF-TV channels (ie: 510 or 670 MHz with a hopping width of +/- 25 MHz)

Keep in mind that the federal government can use virtually any frequency between DC and
light.

Spread Spectrum/Hopping Bugging Frequencies

Legitimate Industrial Equipment (very inexpensive/easy to buy/build)

9.0 kHz - 54.00 MHz Current Carrier Devices (very popular for video)

26.96 MHz - 27.28 MHz
40.48 MHz - 40.88 MHz
902 MHz - 928 MHz ISM band A (Very Popular)
2400 MHz - 2484 MHz ISM band B (Very Popular)
5725 MHz - 5875 MHz ISM band C
10500 MHz - 10550 MHz ISM band D
24000 MHz - 24250 MHz ISM band E

Spread Spectrum Bands Often used for eavesdropping (very inexpensive)
50 MHz - 54 MHz 6.00m Amateur Radio Equipment (STA)
144 MHz - 148 MHz 2.00m Amateur Radio Equipment (STA)
222 MHz - 225 MHz 1.25m Amateur Radio Equipment (STA)
420 MHz - 450 MHz 70cm Amateur Radio Equipment (47 USC 97.305)
902 MHz - 928 MHz 33cm Amateur Radio Equipment (47 USC 97.305)
1240 MHz - 1300 MHz 23cm Amateur Radio Equipment (47 USC 97.305)
2300 MHz - 2450 MHz 13cm Amateur Radio Equipment (47 USC 97.305)
3300 MHz - 3500 MHz 9cm Amateur Radio Equipment (47 USC 97.305)
5650 MHz - 5925 MHz 5cm Amateur Radio Equipment (47 USC 97.305)

Spread Spectrum Bands Occasionally used for eavesdropping
10.00 GHz - 10.50 GHz 3.0cm Amateur Radio Equipment (47 USC 97.305)
24.00 GHz - 24.25 GHz 1.2cm Amateur Radio Equipment (47 USC 97.305)
47.00 GHz - 47.20 GHz 6.0mm Amateur Radio Equipment (47 USC 97.305)

Spread Spectrum Bands Rarely used for eavesdropping (very expensive)
75.50 GHz - 81.00 GHz 4.0mm Amateur Radio Equipment (47 USC 97.305)
119.98 GHz - 120.02 GHz 2.5mm Amateur Radio Equipment (47 USC 97.305)
142.00 GHz - 149.00 GHz 2.0mm Amateur Radio Equipment (47 USC 97.305)
241.00 GHz - 250.00 GHz 1.0mm Amateur Radio Equipment (47 USC 97.305)
300.00 GHz - Light (3 THz) Amateur Radio Equipment (47 USC 97.305)

Note: Most common spread spectrum/hopping bugging equipment will hop at speeds between 100 and 50,000 hops per second. Equipment is readily available that hops even faster (100,000 to 300,000 hops per second). Dwell times can be as small as 1us (one widely used system uses a dwell time of 3-5us).

Outband Equipment

ANY Television broadcast or Cable TV frequency
ANY FM radio broadcast frequency
ANY Paging or Beeper frequency
ANY Cellular Telephone frequency

820 MHz - 960 MHz Modified (902-928) Cordless Telephones
Modified Amateur Radio Equipment (can be on ANY frequency)

Keep in mind that wideband (non-ISM) spread spectrum/hopping bugs are very difficult to detect (even if you are within a few feet). Watch for carrier feed-through, and "Noise Floor Humps".

All Spread Spectrum devices are detectable, just difficult.

Once spread spectrum/hopping bugs have been located (on the RF spectrum) all that can be done is to locate the source of the emission... it is virtually impossible to demodulate a SS signal unless you have access to the key.

Also, a 500mw spread spectrum device can easily have an effective range of over 20 miles. In 1994 I tested a spread spectrum LPD/LPI handheld radio designed for downed pilots. The power would vary between one half milliwatt to one full watt based the quality of the duplex link. With power levels below 25mw we could communicate clearly at a distance of 45 miles on the open ocean (from a life raft), and 15 miles in the dense woods of Maine. When the device was tested in a dense urban area (as a bug) a range of 2500 to 8600 feet was obtained while keeping the power output below 15mw.

Look for spectral anomalies (humps) on the Spectrum Analyzer, and back up with a compressive or wideband receiver.

Utilize search receivers with a wideband IF output (700 MHz), and a wide IFBW (over 3mhz). Look for the signature wideband hump, and then DF the signal to locate the device. Don't be suprised if you find a table leg, bulletin board, cube divider, or wall emitting SS RF energy.

Note: In the early 80's I spent considerable time working with diplomatic spread spectrum devices operating on frequencies between 12GHz and 60GHz (IFBW 300hz to 200MHz). (hint, hint, hint...)

Band Width Resolution and Filters

Examine the spectrum with the following BW resolutions/filters:

Utilize all BW resolutions/filters between 5Hz - 200MHz (depending on band being checked)

For frequencies between 3kHz and 13GHz It's generally best to start with a 3MHz IFBW for a "moving" sweep, and to monitor the wideband spectrogram.

This makes the energy easy to spot, but tough to identify. The IFBW is then modified until it is roughly 80-85% of the signal bandwidth, the results are then sent through a vector analyser to help with identification.

All IFBWs available on the analyser are also cycled through and the results overlayed into a matrix, a little vector analysis is applied, and the modulation parameters are easily extracted.

To handle the microwave bands IFBWs between 10kHz and 200MHz should be used.

Real World Example:
Frequency Hopping device, randomly hops between 530MHz and 750MHz, a IFBW of 3-70MHz will allow the activity to be easily identified, but a narrower IFBW will make it much more difficult.

Hint: A programmable digital spectrum analyzer should be used!
(1/3/5/10/15/20/25/30/50/75/100/150/200... Sequence is preferred).

Here are a few of the suggested bandwidths that you should try for a "fit."

BW Res - Usage/Primary Function
100/200 MHz - Resonate Cavity Bugging Devices/SIGINT Devices
125/35/8MHz - Resonate Cavity Bugging Devices/SIGINT Devices

50/20/10MHz - Diplomatic Microwave Bugs
40/20/10MHz - Diplomatic Microwave Bugs

13/16/20MHz - Microwave Wideband
11/12/13MHz - Microwave Wideband
.5/1/2/5MHz - Microwave Wideband (Burst Bugs)
18/26/36MHz - Satellite Wideband (Video)
2/4/6/8 MHz - Microwave Wideband (Video)
3/6/12 MHz - Microwave Wideband (Video) - Common
.5/1/3 MHz - Microwave Wideband (Video/Burst/Pulse)

1.5/.75 kHz - Frequency Hopping Bugs - VERY Common
.4/.2/.1kHz - Frequency Hopping Bugs - VERY Common
3.2/6.4 kHz - Frequency Hopping Bugs - VERY Common
10/20/25kHz - Frequency Hopping Bugs - VERY Common
50/75 kHz - Frequency Hopping Bugs - VERY Common
100/250 kHz - Frequency Hopping Bugs
300/500 kHz - Frequency Hopping Bugs

1/2/4/8 MHz - Frequency Hopping Bugs

300/250 kHz - Regular Wide Band Broadcast FM
150 kHz - Narrowband Broadcast FM Audio, Television Audio
280 kHz - Narrowband Broadcast FM Audio, Television Audio

200/150 kHz - Commercial Wireless Microphone - High Grade
150/100 kHz - Commercial Wireless Microphone - Concert/Broadcast Grade
58/77/84kHz - Commercial Wireless Microphone - Typical Body Wire
50/60/75kHz - Commercial Wireless Microphone - Typical police device
8/25/50 kHz - European/Japanese Industrial Bugging Devices

50/30 kHz - Wideband FM two-way communications (ie: Cellular Telephone)
16/15/6kHz - Normal FM two-way communications
3/6/8/12kHz - Narrowband Commercial - Voice
1/3.2/6kHz - Narrowband (Marine, HF, etc...)

120/9/1 kHz - Narrowband (Bias Osc./Video Cameras/SIGINT)
30/750/500Hz- Narrowband (Bias Osc./Video Cameras/SIGINT)
56/75/100Hz - Narrowband (Bias Osc./Video Cameras/SIGINT)
30/150/200Hz- Narrowband (Bias Osc./Video Cameras/SIGINT)
250/300 Hz - Narrowband (Bias Osc./Video Cameras/SIGINT)

300/250 Hz - Narrowband OOK/FSK/Data, etc...
300/250 Hz - Narrowband OOK/FSK/Data, etc...

==========

Therefore, I say:
Know your enemy and know yourself;
in a hundred battles, you will never be defeated.

When you are ignorant of the enemy but know yourself,
your chances of winning or losing are equal.

If ignorant both of your enemy and of yourself,
you are sure to be defeated in every battle.

-- Sun Tzu, The Art of War, c. 500bc

197. WSM-1900 ANTENNA ?

Newsgroup: rec.radio.scanner
Date: 1997-01-03 00:00:00 UTC
From: JEFF SCHNEIDER <js@sprintmail.com>
Message-ID: <32CDDDC3.7B46@sprintmail.com>
Source record: 213081
Cross-posted to: rec.radio.scanner,alt.radio.scanner

This I think is a new scanner antenna. Does any one Know about it's performance. It has a dbl. pig tail. and about 18" in length,mag. mount.

ref. page 46 pop. comm. 11/96.

Jeff / js@sprintmail.com

198. Major Bugging Frequencies 1 or 2

==========

Over the years I have had numerous TSCM and intelligence analysts ask for an outline of the RF spectrum used by popular bugging devices. Bugging devices can appear on any frequency between DC and light, this list covers the more common bugging frequencies that tend to be used.

The frequencies that follow are all based on hard documentation (catalogs, intel reports, technical materials, court documents, etc...). For the purpose of intelligence analysis the Source Reliability Scale should be considered A, and the Data Validity Scale should be rated as 1.

This list is updated every two or three weeks, please forward (via US Mail) any technical materials you would like to see reflected in the list.

Remember to check the entire RF spectrum, not just specific frequencies; however, keep in mind that people doing buggings like to stay clustered around certain frequencies.

A Cautionary Note:
Beware of people in the TSCM industry who try to convince you that bugs don't operate above 1GHz or 3GHz, the folks who push this line are playing games with you, or are very poorly informed.

Several PI schools, TSCM schools, and spy shops sell equipment (at highly inflated prices) and actively attempt to mislead students that all they have to do is spend $3,000 to $5,000 on equipment to enter the TSCM field. Markup on these spy shop products are typically greater than 400%, what the spy shop buys for $500, they sell to you for (at least) $2,500, and often more than $5,000.

Several months ago I had the security director from a major U.S. corporation call with equipment problems (he didn't buy it from us). His

"Classified Government Bug Detector" wouldn't work; and when he tried to contact the company who sold it to him he found that they were no longer in business... Later that day he flew up with the equipment, and was amazed to find that we had several of the same unit on the shelf (for $395). He gave us copies of the original invoices which indicated he had paid over $70,000 for his "Classified Government Bug Detector" from a security consulting firm in the New York area (17,721% markup). The product was a simple RF field detector suffering from a dead battery, and a fried RF front end.

There are a number of con artists in the TSCM business (cloak and dagger types) who buy "Classified Government Bug Detectors" for $350 and then resell them to their Fortune 500 corporate clients for $8,500. They remove all of the original markings and apply some stick-on labels with their name on it (or spray paint them), and often re-type the operators manual. Some will even go so far as to have the client sign bogus security clearance document. Note: It's
good that most of these products have rounded corners; although, the spy shops should really include some vasoline with the product...

These special spy-shop packages generally "tops-out" at 1.5GHz, with adapters and mixers the range can sometimes be increased to 4-5GHz... which is of very little use to the TSCM team.

These schools and spy-shops are trying to modify reality and the laws of physics to help them pad their bank accounts... Beware, Beware, Beware...

A legit TSCM inspection (even a basic one) requires at least $250,000 to $300,000 of equipment (often well over $500,000).

Note: The legitimate margin inside the TSCM and technical security industry runs between 5% and 35% depending on the product, which is in line with the margins typical in the computer and communications industry.

Summary (this will catch 99% of all Non-Diplomatic RF bugs)

All TSCM Inspections should include (at least) the following frequencies:
(Expect to see less than .1-15 mw maximum at the TX antenna)
(Do not expect the signal to be present for more than 20uS-100uS)

The device may use the AC power circuits, telephone wiring, or HVAC system as the transmission path (3khz to 300MHz+). The device may also use spread spectrum technology.

To find RF transmitters an antenna search grid of roughly 10 foot by 10 foot (the size of an average office) should be used).

Every cubic centimeter of the facility must be inspected thru visual and electronic techniques.

Look for electromagnetic anomalies on the RF spectrum, not specific modulation types.

Bugs are always installed in groups of (at least) three (the one that was easy to find, the one that you'll find if you really work hard, and then

the real bug; that's almost impossible to find).

Remember:
The only thing on earth that can find a bug is a pair of well trained human eyes, and a set of calloused and experienced hands. The electronic test equipment is only used to suggest to the inspector where to look.

All phone rooms, riser closets, demarcs, boots, etc. must be checked for tampering and RF activity.

The microphone and cameras can be hundreds of feet away from the transmitter or recorder.

Use a digital spectrum analyzer and a wideband receiver with an analog 10.7/21.4MHz SDU on the IF, dispersions of 100/200/500kHz are ideal.

RF Spectrum Analysis and monitoring should take place for at least twelve solid hours before a regular sweep (72 hours or more is preferred).

To prepare for IPM the spectrum should be evaluated/monitored for at least four hours prior to the event.

Most non-diplomatic RF bugs will have a transmit frequency between 3kHz and 9GHz.

However; low cost, high performance bugs are readily available which operate on frequencies between 80khz and 21GHz. For someone willing to spend a little more money; bugging devices can be easily obtained which operate in the 30-50GHz range. This means the person performing a TSCM inspection must inspect well above and below these frequencies.

The spectrum analyzer portion of the TSCM inspection must cover at least 3kHz to 40/60GHz (220GHz+ is ideal). The rule of thumb here is to always check to (at least) double the credible threat.

Audio Detection 20 Hz to 30 kHz Base Band Audio

VLF Detection-Audio .3 kHz to 100 kHz Video Cameras & Tape recorders
VLF Detection-RF 3 kHz to 500 kHz Video Cameras & Tape recorders
VLF Detection-Audio .3 kHz to 150 kHz Microphone/Ultrasonic Chirping

Carrier Current Bugs .3 kHz to 50 MHz 99% Voice (CC and PLA)
Carrier Current Bugs 10 MHz to 350 MHz 99% Voice (AC Mains Antenna)

RF Bugs-HF 3 kHz to 50 MHz 99% Voice
RF Bugs-VHF 30 MHz to 300 MHz 10% Video/80% Voice/10% Data
RF Bugs-UHF 300 MHz to 900 MHz 25% Video/60% Voice/15% Data

RF Bugs-Microwave1 900 MHz to 3.0 GHz 50% Video/40% Voice/10% Data
RF Bugs-Microwave2 3 GHz to 18.5 GHz 65% Video/10% Voice/25% Data
RF Bugs-Microwave3 18.5 GHz to 40.0 GHz 75% Video/ 5% Voice/20% Data
RF Bugs-Microwave4 40.0 GHz to 325.0 GHz Mostly Digital QAM

...and of Course UV/Infrared! (Look for "IR Blooms")

150 - 450nm Modulated UV Light Bugs
350 - 700nm Modulated Visible Light Bugs (450 to 675nm very common)
700 - 1100nm Audio Transmitters/Lasers (880 to 950nm very common)
800 - 1510nm Audio Transmitters/Laser Microphones

750 - 900nm Night Vision Illuminators
900 - 1710nm IR Video Illuminators

...and optical bugs installed INSIDE light bulbs and fixtures

450 nm - Modulated Tungsten bugs
490 nm - Modulated Sodium bugs
575 nm - Modulated Fluorescent bugs

Note: Most military, intelligence and diplomatic TSCM inspections look for devices between 3kHz to 350MHz for Carrier Current/PLA, 20kHz to 20/40GHz for regular RF radio devices, and directional microwave devices from .3GHz to 220GHz+.

... Continued on next post ...

Hi,

I am a firefighter and I just recieved a Motorola Minitor Page. This badboy is not new. It is one of the old ones, but it still kicks butt. The pager came with a charger/amplifier, which can hurt your ears when an alarm comes in. The charger/amplifier casing is white. Does anyone have a clue how old this pager may be. I am curious, because I am wondering how we have them in such good shape.

Thanks,

John Oliver

Scanner buffs and antique scanner collectors:

I have acquired an 8-channel crystal-controlled scanner made by
a company call PATHCOM, Inc, PACE division. Model 308. Do you have
any information about this scanner?

It has two unique features. 1) Although it has only 8 channels, it has
16 crystal sockets inside (2 rows of 8). I might assume that one row is
for VHF HI/LOW and the other is for UHF, except that there are VHF HI and LOW
crystals installed in both banks! (Maybe the previous owner didn't know why
it has two banks either!). 2) Anyway, the back panel has 8 three position
slide switches. VHF HI/VHF LO/UHF. The front panel has the standard row of 8
lights/switches, manual/scan switch, channel selector switch, volume, and squelch.

If anyone has an inkling as to the interaction between the 2 rows of crystals
and the rear panel switches please let me know. And, if you by some small chance
have a manual on this scanner, or know about the PATHCOM company, also please
respond as well.

Thanks,
Perry

Dear Group,

I received a Uniden Sportcat scanner for Christmas and I would like to get a set of better headphones for private listening. The unit comes with the standard cheap earpiece that doesn't provide much quality.

The impedance of the audio output is 32 ohms. I know most headphones have impedances somewhere inn the 4-8 ohms range. Are there any headphones out there that are built for 32 ohm impedances?

Dan Jeska

I had these mods performed by EEB in Vienna VA (800) 368-3270. It cost about $200.00 altogether with shipping etc, but it was worth it! They did good work, and had the radio back when promised.

The Pro-43 is a excellent scanner for the newbie and advanced user alike.
Average Price $160 - $225 depending on condition, modifications, etc.
Manual: go to http://support.tandy.com/support_electronics/2849.html
Find the model no. and look through the detailed parts list. Make sure
you get the USERS MANUAL not the SERVICE MANUAL unless you have some
pretty good electronics background. The service manual wont have the
normal operating procedures. Find the RSU# (Radio Shack Unlimited
Parts Number). Call 1-800-THE-SHACK. Just have them send it normal mail.
They say it will take 7-10 days, but they lie...it will take about
3-4 days. Shouldnt cost that much.

Hope it helps,

Wiggie

The difference between the two is considerable. If you think SM is
overpriced, what you are really saying is that you can't afford it.

>
> If enough people don't buy the Scannermaster guide, the price will come
> back down to earth ($20-$25.)

On what do you base this assumption? Generally print costs go do when the
volume increases, allowing the publisher to sell books, magazines etc. for
a lower cost.

>
> TIA

I just wrote this to someone on the 2006 list and since it's related I'll
post it here as well. A direct answer to your question is that you will
generally get additional attenuation with more ferrites. But you may get
less improvement from each additional one. Other sources of radiation
are probably involved. The video cable is the most likely to radiate,
but some come with ferrites molded on. Do you get the same signals with
the video cable disconnected?

I do not profess to be an expert on this subject but have quite a bit of
experience mitigating EMI problems. YMMV.
Response to someone with his antenna outside the window by his computer
and scanner:
I work on this type of thing for a living. You REALLY need to move your
computer away from your antenna if there is any possible way. If you are
using a discone put it as high as you can as the area projected under the
disc doesn't receive as well. If you can't you will have to engineer a
system of fixes to cut the emissions of your computer and all its
peripherals.
You can try putting a metal plate, foil, or screen between your computer
and the antenna and grounding it to the computer or earth ground-
whichever gives the best results. Or you can try wrapping cables and the
computer case with aluminum foil and grounding where you can. Be careful
not to short anything out and beware of foil near AC and DC connectors!!
Be safe!
Also, be sure to preserve airflow for cooling or keep this test very
short.
Fold all the foil seams together or at least overlap them as a butt seam
forms a slot antenna. If foil wrapping doesn't solve the problem you
probably won't be able to reduce the emissions enough no matter what you
do. If foil wrapping solves the problem you can peel it off a little at
a time to find where the R.F. leaks. Focus on these areas with the
techniques listed below
To accomplish what the aluminum foil does without wrapping your system

is very difficult. Any slot or seam is roughly the same as a round hole whose diameter is the length of the slot unless it has good metal to metal contact. Look at your computer case and see if anything was done to seal the slots formed by the cover, cards, and connectors. You can use copper tape with conductive adhesive to seal all the seams on your computer and its peripherals. Remove paint from sealing surfaces. You can improve the ground connection between all your peripherals with braid or straps. You can put clamp-on ferrites on the cables. You can buy cables with better shielding (with 360 degree terminations at the ends- NO PIGTAILS). All this will involve a lot of experimentation as some changes will not help and may even make it worse. And when I say ground, I mean a braid or copper strap as a wire is just an inductor at R.F..
Also try turning off anything you don't absolutely need powered such as your printer, external modem, etc.
If you can find a major source of leakage you may just be able to fix your problem. A lot of times there are a lot of smaller leaks which are difficult to fix. Be very systematic in your approach and scan as many of the problem frequencies as you can during the testing. You might improve 49 MHz reception while trashing 450 MHz for example if you don't keep checking. I use a spectrum analyzer so I can snapshot from 30 MHz to 1 or 2GHz when I do this for work. And I spend weeks on each project. Even a tight system that passes the FCC and Sysper class B specs for residential use will cause problems when too close to a scanner.

Hope this helps,
Clay Scott

Bill Cheek pointed out the very interesting problem that we have about getting parts and part support of older technologies from radio shack. I too have had this experience with an older model hand held scanner from radio sh*t. The problem with radio shack and others here in the U.S. is: the don't think its cost effective (or prifitable) to keep a large stock of parts in inventory for 10 years.

I deal with another company for some older model stuff (SONY). They still continue to offer support for all of their audio/video gear from 30 years ago (with only a very few exceptions. I find this to be the same with Kenwood (which has a fine line of radio tranceivers and receivers). Why can't radio shack be like these two?

My pointy in all of this is: If a major Japanese held company *THINKS* it is good business to support all their models (for most of the parts therein) for 3 decades, then the U.S. companies should follow suit. Its only good business.

Ha! Good Luck!

I would like to see someone try and beat the New CDMA technology.
There are quite a few levels of complexity built into the
this Standard. One of them is something called the " Long Code"
which is some 40days in length. The listener has to know exactly
where the user is in the sequence to de-correlate the DSSS
signal. Not to mention that the users ESN is mixed in a certain way
with this Long code PN Sequence to add to the complexity.

Have fun!!

this is just a repost of a earlier article from this newsgroup (your welcome)
BC200XLT.1
UNIDEN/BEARCAT 200/205XLT TEST MODE

According to the Uniden/Bearcat 200/205XLT Service Information Manual, the following procedure will load channels 1-25 with various test frequencies, and zero the remaining 175 channels:

1. Press and hold three keys: 2, 9, and MAN simul-taneously and turn the power switch on.

2. Set the power switch to the off position.

3. Repress and again hold three keys: 2, 9, and SCAN simultaneously and turn the power switch on.

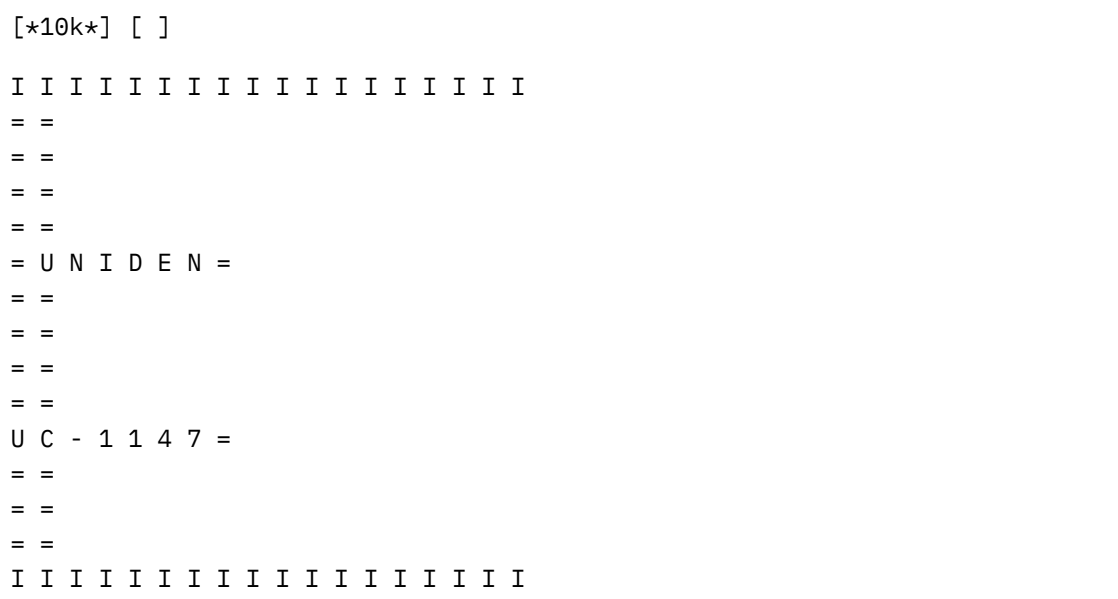
BC200/205XLT CELLULAR RESTORATION

Note: It is unlawful to monitor cellular telephone conversations. It is possible to monitor signals from the deleted ranges even without conversion. Simply add 21.7 MHz to the deleted frequency and enter the higher (image) frequency. Reception is virtually identical in strength to that which would be heard on the deleted frequency.

The frequencies deleted at the factory may be restored, but the procedure must not be attempted by anyone unfamiliar with electronic circuitry. Grove Enterprises assumes no liability for damage caused by this procedure. (I won't either! WA2ISE). The modification will void your warranty.
TOOLS REQUIRED: Small Phillips screwdriver, small wire cutters.

1. Slide off the battery pack and remove the antenna from the scanner.
2. Using a small Phillips screwdriver, remove the two screws from the back of the scanner, the two screws which hold the battery retaining spring at the base and the spring itself.
3. Carefully pry the bottom of the rear cover from the radio and remove the cover.
4. Locate the two small screws at the base of the circuit board and remove them. Gently pull the front panel from the mainframe at the base and

separate them.
5. Locate the (64 pin quad flatpack) microprocessor IC labelled "UNIDEN UC-1147" and the 10k ohm (brown-black-orange) leadless resistor positioned above the letters "DEN" on the IC.
6. Using miniature wire cutters, cut the resistor body in two without disturbing anything else near it. If the left solder pad comes loose, it may be peeled from the board. Brush or blow away any residue. This completes the restoration.



REASSEMBLY

7. Insert the top of the front panel into the slot under the volume/squelch control panel and, noting carefully the alignment of the dual inline connector at the bottom of the board with the mating socket, press the front panel firmly into place. Be sure that the holes at the bottom of the circuit board line up with the holes in the plastic standoffs below them. Insert the two screws and gently tighten them.

8. Replace the back cover by inserting the top of the cover into the slot under the volume/squelch control panel; press the cover into place, insert and tighten the screws.

9. Reposition the battery retaining spring (slotted side toward notched hole), insert the two remaining screws and gently but securely tighten them.

10. Slide the battery pack into place; switch the scanner on to make sure the display comes on. If not, the battery is discharged or the dual-inline connector was misaligned during assembly (see step 7).
Assuming the display comes on, press: MANUAL, 845.0, E; within two seconds, the frequency 845.000 should appear on the display. Cut this resistor

>hasn't advanced much since September, 1986. Firmware has come a long way
>but that is a different story..........

I bought the first 2004 that my local Radio Shack got in stock. It's
been running 24/7/365 ever since, except for power outages. It has a
very dim display, and a noisy volume pot. Other than that, it's never
missed a beat. As Bill says, it has a very well-grounded and shielded
metal case, which you just don't see that much any more in consumer
products. It has no problems with interference from or to any of my
many ham radios or my computer. I haven't seen anything since then
that tempted me to trade up.

So they're not all bad, by any means. Too bad you can't get the LCD
display fixed, though. Someday I guess I'll figure out some sort of
external light to illuminate it. Until then, I strain my eyes or use
a flashlight.

Rich,

I am in Northern NJ as well, and am continually impressed with the new
RELM HS200 hand held, with PL/DPL tone capability, which as you know,
is a must in the northern NJ, metro NYC area.

In this class, for the money, it's probably the best performing hand
held scanner I've ever used, and I've had them all. I find I'm gettin
excellent extended power use from charging the four AA ni-cads.

THE HAM STATION, in Evansville, Indiana is selling them at $249,95, a
great price, for an excellent first offerinf from the NEW RELM line of
scanners.

Watch for the MS200 base/mobile version do out soon.

Tim,

Good to see someone else explaining that a dipole design at least 40 years old is certainly far from the state of the art. I was flying and using those things for communicating 40 years ago. They work, and 1.5dB over isotropic is just about the same as a piece of water pipe made into a dipole, I know I've used one. For the ECM receivers we used real UHF antennas, since we needed maximum performance for ECM.

But, this is not the purpose of my posting.
Reference our recent e-mail contacts.
The same thing happened again at my end - strange and unexplained.
Suggest we ***NOT*** communicate by e-mail until this resolved.

regards,
Dave Holford

231. Car radio antenna for scanning?

Newsgroup: rec.radio.scanner
Date: 1997-01-03 00:00:00 UTC
From: Matclark <josephm@ebtech.net>
Message-ID: <01bbf91d$bc9575a0$LocalHost@josephm.ebtech.net>
Source record: 213177

I tried to use my car radio antenna as a scanner antenna. The result was disappointing. Weak signal heard with the rubber ducky while standing beside the car could not be heard with the car's antenna. Maybe I'm wrong but I expected better, since rubber ducks aren't efficient. I tried various frequencies around 460 MHz and 150 MHz.
Has anyone experimented with this? I'd be interested in reading about it.

I made up a short extension of RG58 with a female Motorola plug on one end and a BNC connector at the other. Does anyone know the impedance of car radio type coax? The center conductor is in a plastic tube with the dielectric being air. Could this be attenuating the signal at the higher frequencies?
Should also mention that the car has a manually operated power antenna. The length could be varied from nothing to about 40 inches. I thought that would have been an advantage.
Any thoughts would be appreciated.

better check with the government about that ,they regulate what can be used in the 46/49 mhz band. there might be such a product already built for that reason. I thought about a amplifier just so I can break in on the phones and play with their heads but the fines the feds would impose on me would exceed my budget(10 million dollar fine for illegal use of these freqs)

>
To do a limit search press Man. then enter the lowest freq. of the range you want to search and press Limit, then enter the highest freq. to search press Limit, then press Search. Frequency coverage is from 29 - 54 MHz, 108 - 174 MHz, 406 - 512 MHz, 806 - 956, cellular blocked of course but gets very nice image from 894.5 - 930 MHz.

Yes you can get a manual from uniden customer service (317) 842-2483 or 1-800-297-1023.

Now for what you won't find in the manual, to clear all channels hold 2,9,MAN while turning it on, to put test frequencies in channels 1 - 21 hold 2,9,SCAN or 2,9,PRI while turning on, to make entire display come on hold 2,9,L/O while turning on.

The 230xlt normally comes with 2 battery packs, AC adapter, charger for 2nd pack and earphone for $215 on up (new). The 220xlt is same radio less 2nd battery and charger for 2nd pack.

I usually get 12 - 13 hours per battery when fully charged even after 1 1/2 years of heavy use.

I have used both the 220xlt and pro-51, I personally like the uniden better (larger buttons, larger display, easier to use and program) my opinion of course.

234. best antenna for air band and 800mhz

I just purchased a Radio Shack "All Band Base StationScanner Antenna"
part # 20-176A, and was disappointed that the reception does not seem better
than the rubber antenna supplied with hand scanner. I temporally
mounted antenna in back yard on 10' pole with 50' of RG-58 coax cable
and plan to move it onto roof as soon as I decide on mast mount hardware.
Is it just the position of the antenna? I have not yet grounded the antenna.
I am trying to keep the price of antenna down. I have heard any antenna would
be better than rubber duck antenna, and Radio Shack said that antenna would
greatly improve reception. I listen to air bands and 800mhz police
frequencies. Thanks, Dennis

: > I'd like to know if the Radio Shack PRO-25
: >scanner is modifiable; probably is, just it hasn't been done.

: Look at it this way: ALL scanners can be modified, you just have to
: know HOW. Think of it like this: If a machine can be built, it can be
: rebuilt. Good luck!

It depends WHAT you're trying to modify it to. If you're trying to get cellular, forget it - try using image frequencies. No amount of component snipping is going to restore anything that wasn't there to begin with - the PRO-25 simply does not have the capabilities to receiving that frequency band. (At least as far as I know. I'm sure someone far smarter than I will correct me.)

As far as all scanners being mod-capable, well.. you might be better off building your own gear. Good luck.

(Why anyone would want to tear the -25 down is beyond me. It's a great scanner.)

I just pulled up this company with yahoo:

http://www.techguardian.com/

They seem to have everything from 400K receive only (like DirectPC) to
receive and transmit to 3Mbps!!! (Screw Bell Atlantic! Who needs 'um!)

Unfortunately the webpage has no prices. : <

I called up and the Service they offer that is equivalent to DirectPC has
software for '95, NT, and Unix (alright!! Linux!) with network options. They
charge a flat $16 a month per 64mb. Hughes wants $26 a month for this.

These guys seem like the way to go.....as far as I'm concerned that
over priced Windows '95 only peice of of shit DirectPC can go suck
dirty donkey balls!

Just for the record, Warren Silverman is a friend and I helped him work on his book (in a very small capacity) and no I don't get paid, I do it out of friendship and a willingness to help others in the hobby.

When I first got into the hobby I bought Police Call. Police Call was and is a tremendous resource but because of space limitations cannot include unit numbers, every agencies' codes, etc. The Scanner Master New York Metro/Northern New Jersey Communications Guide is a grea compliment to PC and is a resource for those hobbyists who want more information than is provided within the pages of Police Call.

My Fifth edition was so dog-eared and coffee stained from use I was glad to see the sixth edition come out just so I had a new one. Probably a week doesn't go by that I don't refer to it for one reason or another. Is it a little pricey at $40.00? Yes. But the amount of information I get from it is well worth the money. I'll gladly spend 40 bucks for a resource like this any day.

I have a scout. I had to buy a FM filter, almost $100 and the short antenna they show in the pictures don't work too good either, so I got an antenna 6" long. Now it don't fit in the pocket no more. But now it works great. It will capture any freq. you want if you can get within 100 ft. I bought mine used and with accessories I spent about $500. I don't use it much though and and would like to sell it. Its rechargeable and I have the manual. My advise is: Optoelectronics is a high profit company. If you need accessories they will cost a lot and its easy to spent more than origanally planned.

Thanks for the advice, I broke down & bought a PRO-62.

First, sorry bout the newbie question. Realized it's doubtless been asked many many times. Went to Deja-News & looked at all the fine advice listed there. Thanks to countless posters, I went to the dreaded Shack & browsed for a while.

Was not impressed by the PRO-62, even tho it had a fairly good rating "group-wise." I figured, "What the hell, I got 30 days to check it out, perhaps I'd learn to work the critter & it'd be fine. But, the first two Shacks I visited tried to sell me returned boxes. This had been mentioned in a few posts. No plastic wrap around units, etc. One unit even had some kind of greasy crud all over it. Food residue? Ack!

3rd Shack had a display unit, with the magic words "Made in Japan" on it. I'd heard the Chinese units were inferior to the Japanese ones, and here was a Japanese one staring me in the face. Quick test in the store showed it to be a much better unit. The sales droid couldn't find one in the back. So I bought the display model after weasling an extra 10% off & an additional years warranty. (The critter was already on sale for $199 -- regularly $299.) Besides, this display model certainly looked spotlessly new -- much better than the ones the other Shacks tried to foist on me.

Get this -- the Droid goes in the back to find the box for the unit & returns with a new unit. Then says the deal was off -- he couldn't sell the display. I checked the new scanner "Made in China." Arrrgghhh. Anyway, I insisted that he'd already sold me the other one. Raised a bit o' hell. Said I wanted the Japanese one not the Chinese one. Blank stare, "All our scanners are made in China." I showed him the "Made in" tags, then *loudly* insisted on the Japanese one, said I'd heard thru the newsgroup that the other was junk -- & started a tirade on the morals of a company that would support slave-labor. I could tell the other customers were starting to enjoy this.

He gets the manager -- repeat of tirade. I end up getting the one I want. The guy rings me up, then starts to remove the batteries from the unit. "Hey, get your hands off my scanner. It's not like there's a shortage of batteries in your store." Weasles! Just gotta out-weasle 'em!

Bottom line: Japanese PRO-62 w/ batteries $180 -- pretty good, huh?

Frequency counters are used to "scan" a large chunk of the RF spectrum and display the frequency having the strongest signal. Typically, they sweep from 30MHz up to 1 or 2 GHz in about 1 second. The most populars models are made by Optoelectronics and range in price from $150 to $900.

To use one of these buggers though, you have to be VERY close to the transmitter to capture the proper frequency. For a typical 1 or 2 watt handheld, we're talking 30 or so feet if I'm not mistaken. For larger transmitters, 75 - 150 feet.

So if you find someone using a transmitter and you can't find their frequency, follow them around with a frequency counter. As soon as they key their transmitter, activate the freq counter and it will show you their frequency(as long as you're close enough to them to convince the freq counter that it's the strongest signal).

I would choose the SC150 over the BCT-7. Do not be fooled
into thinking the highway patrol mobile repeater detector
will be better than the radar detector. Everyone knows a
radar detector is nowhere near foolproof...the BCT-7 is
even less of a guarantee. The SC150 will give you better
mobility, better channel management and 100 search pass
lockout frequencies. Good luck!

246. How to reset BC-230XLT?

Newsgroup: rec.radio.scanner

I can not get a BC-230XLT to do a direct search or even scan on any
of the upper frequencies that the unit is suppose to scan. Is there a reset
feature built in? I do not have the manual. Would someone with the manual
quote the exact key sequence to reset this unit?

> It is priced for $159 marked down from $239. It looks like a return unit.
> Need to know as soon as possible. Thanks, Dennis

Dennis,
To program the search limits, go into manual mode, type in
the lower limit and press LIMIT, type in the upper limit and
press LIMIT, press SRCH.
The twelve bands referred to are the frequency ranges
that the BC230 can "listen" to(29.0-29,7, 29.7-50, 50-54,
108-137, 137-144, 144-148, 148-174, 406-420, 420-450,
450-470, 470-512 and 806-956(minus cellular)MHz).
As for the reset, most Radio Shack and Uniden units can
be reset by holding down the 2 & 9 keys while turning on the
radio.
The Pro-51 is very similar to the BC230(except for their
usual selling price($300 vs. $220). They cover the same ranges, both
have 200 channels, service search, programmable
search, and weather search. The Uniden has 10 priority
channels to the RS's one. The Uniden also has ten search
lockout frequencies while the 51 has none. The Uniden scans
twice as fast and can search three times as fast in certain
ranges. And the 51 is made by Uniden too.
Call 800-297-1023 to see if you can get a replacement
manual for it and what it will cost.
$159 is a very good price for this radio. If you do pick
it up, be sure all features work. And does it still have the
special charger(CRX120) and extra ni-cad batter that it is
suppossed to come with?

The AOR AR8000, AR3000 and others have a serial interface. Also, PRO 2006/2035/2042 can be computer controlled with an add-on interface from Optoelectronics. Writing programs to computer control it might be re-inventing the wheel as there are a number of commercial and shareware programs already around which are quite good.

>Still, I doubt you could convince the military to buy a Lexus.

Sorry to rip on you Dan, but I had to get a shot in against the Lexus. I tried sitting in one of them. I'm not sure which model, but I'm sure it was well over $45K. I couldn't sit straight up in it. They had lowered the interior of the vehicle to accomodate the "moon" roof. I'm certainly not going to purchase a vehicle in which I have to tilt my head to the side to sit in it. Especially one that has a price tag 3 TIMES the going rate of a car from Detriot that I can sit in comfortably. What does a Lexus provide in addition to a "standard" vehicle from Detriot that costs another $30,000? Is it the L with the circle around it on the wheels?

Sorry, just had to get that shot in there. No, no scanning here.

From: anonid@alt.net
Message-ID: <5ajcql$i78@tofu.alt.net>
Source record: 213197

I recently had a chance to see the Monitor America Idaho section, which consisted of all of about 6 pages. I already have many of the frequencies listed in this section, but there were some that I did not have. I cannot justify spending $39.95 for six pages of frequencies (of which I already have 85%).

Would anyone who has the latest version of this book be willing to share (or sell?) a copy of the Idaho listings from Monitor America? Perhaps you could scan the pages in and e-mail them? or I could send you postage and a fee for your copying?

BTW, any other Idaho scanning fans?

253. Uniden BC150 (Sportcat)--good(?)

Newsgroup: rec.radio.scanner
Date: 1997-01-03 00:00:00 UTC
From: sderby@best.com
Message-ID: <5aji0b$2fo@shellx.best.com>
Source record: 213199

After seeing a lot of comments about Uniden's Sportcat being a good "first scanner", I bought one for myself. I'm not very experienced with scanners (the Sportcat is my first), but it seems like a nice little scanner for the price. There is one feature I wish it had, though: programmable search limits. I haven't decided whether programmable search limits are worth enough to me to look for a different scanner though. (As it is now, I can search the preprogrammed search limits, but some of the bands are pretty wide).

Is this feature expensive, or is there a handheld scanner out there of comparable quality and price which has the programmable limits? (I can always return the Sportcat and buy a different one).

A second question: If I keep the Sportcat, I think I'm going to ditch the rubber ducky and get a better handheld antennae. Any recommendations? I mostly use the mid-to-high 800 MHz band (police, sheriff, emergency services, etc.).

> questions arised and I was wondering if you could answer them for me?

> When you tap the baseband audio, is it wideband, or narrowband? It's the
> audio bandwidth right? What exactly is it's bandwidth?

At the NFM discriminator output and before any shaping or filtering,
the bandwidth is essentially the same as the last IF, or in most
scanners, about 15 kHz.

> If this mod were
> performed, would it facilitate WFM mods for scanners such as the PRO-43

Well, not exactly because the PRO-43 doesn't have the WFM mode,
so that's moot. In any event, it isn't a "mod". It's just a
place to tap into for full signal bandwidth. Take computer data
signals that use FSK, for instance. At 9600 baud, a bandwidth
of about 10-20 kHz is required. Well, an FSK signal can still
be heard in the speaker, but at that point, the bandwidth is
3 kHz, and no amount of detection and processing can recover
what was lost in the filtering stages. So to decode 9600 baud
data, you MUST take the signal at the output of the NFM
discriminator where it is at full shape and gain specs.

> or is that bandwidth regulated by the IF stages of the scanner?

Exactly....at least the bandwidth of the baseband signal can't
be any wider than the BW of the IF stages that carried it. The
IF of most NFM sections is 455 kHz, the BW of which is 15 kHz.

> How wide is WFM for scanners anyway? Standard FM broadcasts are
> 200khz channels. That's pretty wide isn't it?

First....not all scanners have WFM mode. And those that do,
do so with a SECOND, separate circuit, and usually a totally
separate IF section, typically 10.7 MHz. You NEVER find WFM
and NFM modes processed by the same circuit.

But anyway, yes, the channel allocations for the 88-108 MHz
FM Broadcast band are 200 kHz, however the maximum allowable
```

transmitted bandwidth is 150 kHz with a 25 kHz guardband on each end. Most WFM receivers have about 200 kHz of IF bandwidth, with exception of the best stereo rigs might take the full slot and a little more. Communications rigs are tighter, and probably can vary from 60 kHz to 200 kHz, depending on the quality of design.....but scanners appear to come in at 100 kHz or so.

Again, though, we are talking two totally different and separate circuits for those scanners and receivers that have both NFM and WFM. You'll see in my Discriminator List where different chips are listed for each.

Therefore, depending on your application, your "baseband audio" would be taken from one or the other of the two chips. Like for SCA signals, you'd tap the WFM baseband output. For CTCSS and DTMF signals, you'd tap the NFM Discriminator output. For satellite telemetry, you might get good results from the WFM baseband since NFM is tighter than the typical 20-50 kHz used by satellite data signals.

AM signals, by the way, are usually only PARTLY processed in the NFM chip and then extracted (still at the 455 kHz level) before the NFM discriminator, and routed out through separate IF filters (6 kHz) and additional amplification before being fed into a standard diode detector/demodulator. So the AM baseband (rarely used or needed by scannists and hackers) exists at the anode of the detector diode.

Clear as mudd?

The problem with 'Net information is that text files can only convey so much information before so much gets lost in the translation. Books and magazines remain a better resource for technical information than plain ASCII text files.

To that end, there is an appropriate book coming out soon by Jerry Pickard and published by Index Publishing Group, Inc. called:

SCANNER MODIFICATIONS AND ANTENNAS

I made one out of a left over CB metal whip, a PL259, a plastic (teflon?) some epoxy and solder.

What I did was first cut the whip to length. Then drill a hole through the plastic plug. Slide the plug on the whip and then press the end of the whip through the coax end of the PL259. Then mix up the epoxy and fill the area surrounding the whip in the PL259. Then screw the plastic plug down into the PL259. I also used a little epoxy to seal the plug in the PL259 and help waterproof it.

Everything came from the junk box, except for the epoxy. Total cost was about $3.00.

I haven't picked up a thing on either freq. yet, Middletown just
installed a new tower and upgraded the comms. facility. I am surprised
that they didn't move up to 800 land.

Question has anyone heard the City Police 800 system?

Reports are it is a MOTOROLA system but unlike all that I have heard this one has some type of anti-scanner tones like GE>

I was told that after a voice tx the system sends some type of noise CONTINUOSLY on that channel UNTIL another voice tx comes along on that channels.

Anyone ever heard of Motorola transmitting anything like this, other than DVP scrambling?

Thanks

John,
Check out:

http://ftp.barc.org:8080/pub/hamradio/mods/uniden/bearcat/bc855xlt.mod

This is from the Boston Amaetuer Radio club's FTP archive. The have alot of
stuff. The base URL is:

http://www.acs.oakland.edu/barc.html

This ought to do it for you.

Steve

P.S. There are two versions of BC855XLt's out there. The mod listed worked
on my unit (the old version). If you have the new version, it won't match
the directions, so if your's looks like the mod sheet says, go for it. If
it doesn't, good luck finding it somewhere else.
Let me know if it works for you.

There are actually two version of the radio and thus two different mods.
Just about any good scanner page will have them. If you don't have any
luck I can get them and e-mail them to you...just get back to me.

Joe

You might just go to
http://support.tandy.com/support_electronics/8555.html. Go to the
DETAILED PARTS LIST and find the RSU#. I did the work for you it is
10845147. Call up 1-800-THE-SHACK and order it. Just have them send it
normal mail. They will tell you it will take 7-10 days, but I find
that it will only be about 3-4 days. I dont have the basic knowledge
to program the frequencies.
The basic operating instructions can also be found on that page.
Hope it helps,

Wiggie

I think this phone may be shifting frequencies more than 1 million
times each second! :-) Seriously. There is another (older) spread
spectrum technology which shifted among a handful of frequencies
several times a second, as you are describing. I'm not sure, though,
if this was ever used for cordless phones.

So a regular scanner is definitely not going to receive this phone in
any useful way. At the very least, it would require a wideband
receiver, and I'm not even sure that would do it. Once one had a
receiver capable of receiving this phone, it would then be necessary
to convert the digital codes (they are bytes, kind of like
Soundblaster, etc. does with audio) back to audio. If one believes
what the box says, these bytes are also encrypted (my guess is that
the encryption would not be hard to break if one knew the algorithms
used by the phone).

-------------------------->>
I believe I posted the following information once before, but if I didn't
I most certainly intended to.

I would recommend in the strongest terms that anyone and everyone
who had a subscription to U.S. Scanner News call the Attorney
General's office at the number listed above (I assume it is the
correct number!!!)

I'm Roger Cravens and I wrote the U.S. Government column for
USSN. The writers for that magazine had not been paid since
on or about January, 1996.

Most of the writers attempted to reason with both bob Gehri
and Ken Gilbert which got us absolutely nowhere. About
a month before they finally went under, Bob Gehri dropped
completely out of the scene leaving Ken Gilbert holding the
bag so to speak. But as far as I know, both are liable for
repayment.

If nothing else, a class action suit could possibly be brought
for mail fraud for accepting money (subscription moeny) when
these two knew the magazine was going under.

Another excellent recommendation would be to contact your
local post office and file a mail fraud complaint. Believe me,
if it's possible, they'll get your money back and the government
will bear the expense of putting these two guys in jail for
mail fraud.

Regardless of how it turns out for you all, you have my
best wishs for successfully getting your money returned.
But I wouldn't hold my breath.

Personally, the U.S. Post Office is your best and quickest
bet for resolution, plus putting these two guys perminantly
out of business.

The 910 is the under $100 900 by Vtech right? If so, it _is_ analog,
and can be easily monitored in the clear. Its 10 channel capability also
is a drawback.

IF you mean more interference, I would believe that. Gasolines are
supposedly blended for area, altitude, and weather. In colder weather
less volatile fuels require more "pedal"....more load can = more spark
noise. Heater fans can make a lot of static too. Alternators working
overtime, driving headlights, can also make more noise.

good luck

Don't pay the $25. It's an easy mod, I had one, and did it myself. I
gave the mod instructions away, but check your local library or used
book store for a scanner mod book. Old issues of MT also occasionally
list it. I got the mod sheet from Tucker Electronics in Garland, TX,
although they are no longer in the radio business.

I'm looking at both the AOR-8000 and the Yupiteru MVT-7100. Has
anyone had experience with either or both that they could share?
What are the benefits for each one?
Is the bandscope on the AOR-8000 programmable, or does it always cover
the same range and frequencies? (i.e. could I set the min/max to
20.0mhz and 20.1mhz, or is there a specific range i.e. I could only
set it to 20mhz-30mhz, 30mhz-40mhz, etc. for a 10mhz range.
Also is the frequency range programmable or does the bandscope always
center around the frequency I'm listening to? If I'm listening to
470.25mhz could I have the bandscope range at 700mhz-710mhz?

Thanks,
Justin

307. Re: cellular mod for BC200XLT

Newsgroup: rec.radio.scanner

Message-ID: <NEWTNews.852404879.11551.dr7zyq@nidlink.com>
Source record: 213041

I had a 200XLT and did the cellular mod. Two points:

1. Using the image frequency, reception really was just as good as was experienced after the mod. Go figure.

2. Even after doing the mod, the radio will scan in 12.5kHz steps -- not in the 30kHz steps that are standard to cellular use, so you are still going to miss a lot.

It just isn't a hot cellular radio.

If you already have some walkman type headphones (i.e. stereo with 1/8"
plug), Radio Shack sells a connector for $1.99 that gives you sound from
the scanner's mono jack on both earpieces.

Hello everyone,

I've been a scanner enthusiast for quite a while now. I have a question about some of the prices Radio Shack offers on their closeout scanners. About a year ago, I bought my first scanner, a pro-2026, from Radio Shack for 139.95 (110.00 off the list price). Does Radio Shack often sell scanners like this for such cheap prices? It seems like there are a lot of people who post to usenet saying they got a "great" deal on a scanner from Radio Shack when they are closing out certain scanners. Do they offer deals and prices like this very often? Also, has anyone else out their bargained the price of a scanner down, like if it's the last one they have and it's a display model? I'm looking at picking up a second scanner and if they do this often, then I will keep my eyes wide open in Radio Shack. Thanks in advance.

Hi,

A few years ago I purchased a CAT converter for my FT767, built in the head shell of the 25pin socket and made by JCom.

The interface was built around the Dallas 1275 chip and was powered from the 232 interface.

Does anybody know the whereabouts of JCom nowadays? or anybody else who makes a similar interface?

Basically I want it to connect either my AR8000 or Opto Cub to my PC.

TIA

Dave Cripps

Radio Shack is a great place to buy scanners when they are on sale.
Especially
when they are closing out a model ("Where As-Is" sales as they call them in
there ads). I had also gotten a PRO-2026 for $149.00 when they were
closing out the
cellular enabled versions of the scanners. About every month or so I get
the lastest
sale paper in the mail. They seem to have at least one scanner on sale at
any given
time. As to whether it's a bargain or not depends on what your looking
for.

As far as talking down the price of an item depends on the store. I had
bought the
PRO-62 just 3 months before the introduction of the PRO-26. I called one
store to
see if I could trade my PRO-26 in. The manager said that the scanner must
have
been bought less one month ago. I called another store and they said that
if the
scanner was in good condition, they would take the trade-in. Later that
day I was
able to trade the scanner plus the difference in cash on a new PRO-26. I

received
full credit for the PRO-62 and the leather case I had bought for it.

319. Mobile scanner antennas

Newsgroup: rec.radio.scanner
Date: 1997-01-04 00:00:00 UTC
From: Eric Plent <eplent@injersey.com>
Message-ID: <32CECC32.2B6F@injersey.com>
Source record: 213053

Can anyone give me any information on these "invisible" scanner antennas I see advertised by companies like Grove? They have one in a recent issue of Monitoring Times that says it uses the whole structure of the car as a full-spectrum antenna (it looks as if it clips to a grounding point somewhere inside the car and uses the metal frame as the antenna). Do these things actually work? What about the adapters that hook your scanner to the AM/FM radio? My initial reaction to that one is that it would work great in the VHF area, but not too well on higher frequencies (UHF, 800Mhz, etc).

Any thoughts?

- E

> frequencies. Thanks, Dennis

I wouldn't be too quick to blame the antenna. You're probably
loosing quite a number of dbs with that 50' of RG-58 cable.
Try some RG-8, RG-6 or 9913.

For kicks, use a short length patch cable between the antenna
and scanner and see how it does. If the antenna appears to do
as you expect, then you'd probably feel safer making the
investment in better co-ax.

Good luck!

323. Q: re PD-203 POCSAG decoder

Newsgroup: rec.radio.scanner
Date: 1997-01-04 00:00:00 UTC
From: tswisher@freenet.columbus.oh.us
Message-ID: <5amlh1$8bm@login.freenet.columbus.oh.us>
Source record: 213057

All;

I've built the little interface (used the ultra-simple one found in the JVFAX documentation; it works great with everything including Hamcomm, JVFAX, and Pktmon), and am using baseband audio from the discriminator of my Pro-2004. However, with PD-203 all I'm getting is gibberish. In addition, as the program runs, the notation on the status bar that gives decode percentage drops continuously from 80-90% until it is around 10%.

Any ideas? Could the polarity be reversed? If so, how does one change it?

Roger,

The next time the tower tells them to switch to guard try searching the 138 to 144 mHz area in AM mode, 25 mHz step size. Many air-to-air comms are in this range. Also, of course, try the 225 to 400 mHz range, but this takes longer, so try 138 to 144 first, and don't forget to switch to AM mode, since most scanners automatically set the mode the NFM in this range. Good Luck.

Also, "guard" is the term commonly used to refer to 243.00, the military calling and emergency frequency. This may also be what the tower is refering to.

Was just in my local Radio Shack and noticed they have a
number of scanners on sale. Namely, the Pro-25, 70, 60, 62,
2037 and 2046. Prices were $60 to $130 off. Anyone waiting
to snatch up a good radio at a good price, now's the time!

326. BAT callsign

Newsgroup: rec.radio.scanner
Date: 1997-01-04 00:00:00 UTC
From: jtward11@aol.com
Message-ID: <19970104223500.RAA01563@ladder01.news.aol.com>
Source record: 213060

All,

Twelve F-16s just landed at MacDill AFB in Tampa, all using the BAT callsign, in conjunction with numbers, i.e. BAT 21 and BAT 11. These were two flights of six aircraft each, with 21 and 11 being the flight leaders.

My only reference to BAT callsigns are for A-7s of the Iowa Air National Guard at Souix City. Has this unit transitioned into F-16s? Does anyone else have any info on a unit using the BAT callsigns.

BTW, upon doing a quick search I found the air-to-air comms on 138.875 for these aircraft. I LOVE my BC-9000XLT!

Yeah, sometimes the guys at Rat Shack are pretty nice about stuff. The younger guys tend to know the score when I go in there, while the older ones always want to know why I'm buying a part or why I'm returning it. They can be serious jerks if you give them a smart-ass answer. Generally no one in the store is terribly knowledgeable about the stuff I need, which bugs me sometimes. "Radio Shack. You've got questions. We've got shrugs."

From: john babrick <antialias@earthlink.net>
Message-ID: <32CECAF2.15AD@earthlink.net>
Source record: 213062

Are the data protocols of cellular and/or trunking systems
documented somewhere publically? What I am looking for is the
information needed for me to write a program which would
interpret where converstations were being routed to, etc...
Also, modulation techniques and baud rates would also help...

I heard of such a thing a while back from a buddy of mine who works for
the GA Bureau of Investigations. It seems that they were using an item
that sounds just like that. I had ask him where the antenna was on his
car and he led into this device that uses the whole structure of the car
as an antenna he said it worked real well for them and kept their
undercovers from looking to out of place with antennas all over them.
They operate in the 400mhz range.He also told me that several Fed.
agencies were using these also

If it's very cold out, you need to give the car more gas to get it going.
This means that the spark plugs will be firing more, and each spark
generates radio interference. Also, as he said, alternators, fan belts,
etc, can cause interference.

Eric:

You just answered your own question! Yes, it uses the body of the car for the antenna, and it doesn't work very well on the high end.

You might do better with Radio Shack suction-cup mount, and your own rubber ducky.

This is changing, however. South Australia is moving to a statewide trunked system for all government departments and emergency services within the next 2-3 years. Network roll-out starts this year. Motorola has won the tender for this job. Word is the emergency services will be forced to move to this despite their opposition to the move.

>
> - Here we have Motorola trunking 800mhz but this mainly has business users.
> So we dont have to deal with trunking problems yet.

Some government departments (eg Police Security) also use SmartNet trunking in Adelaide. The new government radio network will be based on SmartZone, as is the New South Wales government radio network. Victoria uses the Telstra/OTC Fleetcoms trunking system on both VHF and UHF (403-420MHz). Tasmania are going to an Ericsson system and Queensland is likely to move to one of these systems too.

We actually have 4 trunked systems operating in Adelaide. Motorola has 2 Smartnet systems (not linked together) on 800MHz, Telstra has their Fleetcoms network (MPT1327/MPT1343) and one of the communications retailers has their own single-site MPT system as well. The MPT-based systems in Adelaide all operate on 403-420MHz.

>
> - We also dont have a big range of scanners. We have the usuals like

The range is bigger than you think. Lots of names like Regency, Yupiteru, AOR, Uniden, Tandy, in fact most of what is available overseas is also available here.

The Australian-spec FT51R will *not* go above 470MHz (AFAIK). The new model Yaesu radios sold through the official importer (DSE) have custom PROMS specifically done for the Autralian market (since the FT-530, hence its TX coverage from 420-450MHz).

It isn't possible to make them TX out of band nor to extend the RX coverage by any programming tricks or hardware mods that I'm aware of. Sorry.

Mind you, I'm quite prepared to be proven wrong on this one ;-).

The only thing I have seen was a plan to make a "repeater" out of a
baby monitor - can't remember exactly, but the general idea was to use
the baby monitor to monitor a base scanner unit - this way you could
take the small remote for the baby monitor out in the yard, garage,
etc around the house and listen to your scanner.

I stumbled across it while searching Yahoo one day for
scanner/shortwave sites.

good luck

As published in the AR8000 Manual.

Frequency Range: 500 kHz to 1900 MHz (the actual limits are 100 kHz-1950 Mhz)

Recieve Modes: AM, NFM, WFM, USB, LSB, CW

Freq Step Size: 50, 100, 200, 500 Hz, 1, 2, 5, 6.25, 9, 10, 12.5, 20, 20, 25, 30, 50 100, 200, 250, 500 kHz or any multiple of 50Hz up to 999.995kHz

Recieve Sensitivity: 500kHz to 2.0 MHz
SSB by field signal strength
AM by field signal strength
2.0 MHz to 30 MHz
SSB 1.0 ?V
AM 3.0 ?V
NFM 1.5 ?V
30 MHz to 1.3 GHz
SSB 0.25 ?V
AM 1.0 ?V
NFM 0.35 ?V
WFM 1.0 ?V
1.3 GHz to 1.9 GHz
NFM 3.0 ?V
AM/SSB S/N 10dB
NFM/WFM SINAD 12dB

Selectivity: SSB 4 kHz (-6dB), 15 kHz (-50dB)
AM/NFM 12 kHz (-6dB), 25 kHz (-60dB)
WFM 180 kHz (-6dB), 800 kHz (-50dB)

Antenna Impedance: 50 ohm BNC

AF Output (at 4.8V): 120 mW (8 ohm) THD 10%

Power Req: 4.8V NiCd
6.0V Manganese/Alkaline
EXT 9.0-16V DC

Power Consumption: 160 mA (nominal)
110 mA (standby)
20 mA (power save)

Memory: Memory Channel: 50 channel X 20 bank - total 1000
Pass Channel: 50 channel X 20 bank - total 1000
Priority Channel: 1

Scan/Search Rate: 30 channels/sec max.

Run down to your local Goodwill or Salvation Army. You can pick
up used Fisher Price or Gerry baby monitors for under $5.

Adding an external input to these is a piece of cake. There is a
mod for the Fisher Price monitor in the repositories.

I use one to re-broadcast my main scanner to a portable (ie:an
"extender")..

If you are lucky enough to find a Gerry "two-way" model, you can
easily set up a mini-repeater, as it has VOX capabilities and
does not xmit continuously.

Most of them revolve around discrete xtal controlled transmitters
and Motorola MC3359/61 receiver IC's.

It's more "fun" to modify an existing design than to build one
yourself. Trust me! All the parts are there!

>
>Larry AET-SC engineer
Exactly!!! its called FVOC. Using a Flip though, you can actually
decode the signal (via a hex code), convert it to dec, and go to the
new freq to follow the call. Have to be fast at converting hex to dec
though! :)

Oh & I forgot to add...

A stored channel retains info on:
Frequency
Mode
a 7 char text tag
Attenuator status
Select scan status
Pass status
Priority status

Scan options:
Scan delay
Audio scan
auto terminate monitor time
level cutoff

Hi,

I have a new Pro26 and it worked much better in my car (with stick on glass external Radio Shack antennea) before the cold winter weather. I had always thought that cold air would transmit signals better/farther. Am I wrong? Is my radio on the fritz? Or am I just getting a less clear broadcast becasue of increased interference from more signals?

Thanks for any help,

Nigel < baystarinc@aol.com >

>programs already around which are quite good.

Not necessarily (reinventing the wheel, that is). There are a couple
of programs either already released or in beta that control the
PRO-series scanners via CE-232 interface unit, and a couple of others
that allow recording of audio with or without an interface. But every
one that I've seen so far is a DOS application (even the brand-new
ones), and the DOS-soundcard-Windows95 combination can be very
temperamental. It would be really nice if someone would finally
develop some 16- or 32-bit WINDOWS software for these interfaces.

THIS IS THE FAIREST MOST HONEST WAY I KNOW TO SHARE THE WALTH! Hello!

Would you like to make thousands of dollars, quick, legally, with NO CATCH?
Then keep reading.....Please take five minutes to read this article it
will change your life, just like it did mine. It's true!
You can make up to or over $50,000 dollars in 4-6 weeks, maybe sooner! I
SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested,>keep reading; if you're not, I appoligize for wasting your time.
Here we go. A little while back, I was browsing though these newsgroups,
just like you are now, and came across an article similar to this that said
"You could make thousands of dollars in weeks with only an initial investment of $5!" I thought, "Yeah, right, must be a scam", but I was
curious, like most of us, so I kept reading. Anyway, it said that you send
$1 to each of the 5 names and addresses stated in the article. You then
place your own name and address in the article at the bottom of the list
at
#5 and post the article in at least 200 newsgroups (there are thousands).
No catch, that was it! So after thinking it over, talking to a few peolpe
first, I tried it. I figured what have I got to lose except for 5 stamps
and $5, right? Well, guess what.....with 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and
didn't give another thought. Butthen money kept coming IN, tripling in
size and multiplying by 10-20 times the amount that I got the first week!
In my first week I made about 20 to 30 dollars. But by the end of the second week I had made a total of over $1,000!!! In the third week, I had
over $10,000 dollars and it's still growing. This is my fourth week

and
I've made about $42,000 TOTAL and the money is still coming
in.....
Let me tell how this works and most importantly, WHY IT
WORKS.....ALSO
MAKE SURE YOU PRINT A COPY OF THE ARTICLE NOW, SO YOU GET THE
INFORMATION
OFF OF IT, AND BEGIN MAKING MONEY.

The process is very simple, and it consists of 3 EASY STEPS:

STEP 1: Get 5 separate pieces of paper and write the following on
each>sheet of paper....."PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE
NUMBER
4." Get five $1 bills and place ONE inside each piece of paper that
you
just wrote on and fold each piece of paper so the bill will not be
seen in
the envelope (otherwise, nosey people who liketo steal envelopes with
money
in it will get yours). Put one paper inside the envelope and seal
it.
Do
the same for all 5. You should now have 5 sealed envelopes, EACH have
a
piece of paper and a $1 bill stuffed inside of the paper. What you
are
doing is creating a service by this, this is PERFECTLY LEGAL. Now
then,
mail the 5 envelopes with the paper and $1 in each to the following 5
addresses:

1. H. H., 435 Franklin TPA Apt 1, Mahwah, NJ. 07430
2. Bruce, P.O. Box 63, 4700 Keele St., North York, Ontario. M3J
1P3
3. J Kallam, 50 Richmond Drive, Clayton, NC 27520
4. K. Cedeno Jr., 140 Millbrook Ave, Randolph, NJ. 07869
5. T. Nelson, 1125A Gumwood Ave, GFAFB, ND 58204

STEP 2: Now take the #1 name off the list that you see above, move
the
other 4 names up (5 becoming 4, 4 becoming 3, etc.) and put YOUR NAME
as
number 5 on the list. You can slighly alter this article if you need
to,
editing what you need to edit.

STEP 3: Post your amended article (with your name at #5) to at least
200
newsgroups (I think there are close to 22,000 of them).

HOW TO DO THIS: If you have Netscape 3.0 do EXACTLY the following:

1. Click on any newgroup as normal, THEN click on 'TO NEWS', which is
on
the far left when you're in the newgroups page. THis will bring up a
box
to type a message in.

2. Leave the newgroup box as it is, CHANGE the subject box to
something
flashy, like 'NEED CASH $$$ READ HERE $$$ or FAST CASH $$$'!!!

3. Tab once and you should be ready to type. Now, retype (only once)
THIS
whole article WORD FOR WORD, except to insert your name at number 5
and to
remove number 1 off the list, plus any other small changes you think
you
need to make. Keep almost all of it the SAME!

4. When your done typing the WHOLE article, click on FILE in THIS
BOX,
RIGHT ABOVE SEND, NOT WHERE IT SAYS NETSCAPE NEW ON THE FIRST BOX.
Click>on SAVE AS when you're under FILE. Save your article as a text
file to
your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO
THIS.
Once saved, move on to number 5 below.

5. If you still have all of your text, send or post to this newsgroup
now
by just clicking send, which is right below FILE, and right above Cc:.

6. Here's where you are going to post all 200. O.K, click on any
newsgroup then click on 'TO NEWS', again in the top left corner.
Leave
the NEWSGROUP BOX alone again, put a flashy subject title in the
SUBJECT
BOX, hit TAB once you're in the body of the message, and then click on
ATTACHMENTS, which is below the SUBJECT BOX. You will get another box
to
come up. Click on ATTACH FILE, then find YOUR file that you saved;
click
once on the file, and then click 'OPEN' now click O.K; if you did this
right, you should see your file name in the attachments box, and it
will
be
shaded green.

IF YOU USE MI EXPLORER IT'S JUST AS EASY.......HOLDING DOWN THE LEFT
MOUSE
BUTTON, HIGHLIGHT THIS ARTICLE THEN PRESS "CRTL" KEY AND THE "C" KEY
AT
THE
SAME TIME TO COPY THIS ARTICLE. THEN PRINT THIS ARTICLE FOR YOUR

RECORDS
TO HAVE THE NAMES OF THOS EYOU WILL BE SENDING $1 BILLS TO. NEXT GO
TO
THE
NEWGROUPS AND PRESS "POST AN ARTICLE" A WINDOW WILL OPEN. TYPE IN
YOUR
HEADLINE IN THE SUBJECT AREA AND THEN CLICK IN THE LARGE WINDOW BELOW.

PRESS "CRTL" AND THEN "V" AND THE ARTICLE WILL BE PLACED IN THE
WINDOW.
IF
YOU WANT TO EDIT THE ARTICLE , DO SO AND THEN HIGHLIGHT AND COPY IT
AGAIN.

NOW EVERYTIME YOU POST THE ARTICLE IN A NEW NEWSGROUP ALL YOU HAVE TO
REPEAT IS "CTRL" AND "V" AND PRESS POST.

7. That's it. Each time you do this, all you have to do is type
in a
different Newsgroup, so that way, it posts to 200 DIFFERENT
newsgroups,
you
see!!! Now you just have 199 to go!! (don't worry, each one takes
about
30 seconds, once you get used to it) REMEMBER 200 IS THE MINIMUM.
The
more you post, the more money you will make.

AND THAT'S IT!!!!!!!!!! THAT'S THE ONLY 3 STEPS THERE IS! ! ! ! ! !

You are now in the mail order business and will start receiving your
$1
envelopes from various people all over the world within days. HINT
THE
MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILL MAKE. You may
want
to
rent a P.O.Box eventually because of all the mail. If you wish to
stay>anonymous, you can come up with a name, such as "manager" or
"investor".
Just make sure all the addresses are correct, PLEASE.

LET ME TELL YOU WHY THIS SYSTEM WORKS! ! !

Out of every 200 posting, lets say I ONLY receive 5 replies, which is
actually VERY LOW. So I made 5 dollars with my name at #5. Now
then,
each person who just sent me $1 makes, say only 200 postings, now with
your
name at #4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours
too.
50

people send you $1 now; thats $50 you just made! Now, then your new 50
again post 200 each with YOUR NAME AT #3, or 10,000 POSTINGS (50x200).

Average return is 5,000 at $1 each, which is $5,000!!!! And finally, 5,000
people make 200 posting with YOUR NAME AT #1. YOU NOW GET A RETURN OF
$50,000 BEFORE YOUR NAME DROPS OFF THE LIST. AND THATS IF EVERYONE MAKES
200 POSTING ONLY, AND IF ONLY FIVE PERSONS RESPOND!!!!!!!!!!!!!!

When your name is no longer on the list, you just take the latest posting
that is appearing in the newsgroups and SEND OUT ANOTHER $5 TO THE NAMES
ON
THE LIST, PUTTING YOUR NAME AT #5 AGAIN. And start posting again. The
thing to remember is, do you realize that THOUSANDS OF PEOPLE ALL OVER THE
WORLD ARE JOINING THE INTERNET AND READING THESE ARTICLES EVERYDAY, JUST
LIKE YOU ARE NOW!!!!! So can you afford $5 and see if it really works?

I think so.....

Peolpe have said, "What if the plan is played out and no one sends you the
money? So what! What are the chances of that happening when there are
TONS OF NEW HONEST USERS AND NEW HONEST PEOPLE JOINING THE INTERNET AND
NEWSGROUPS EVERY DAY AND ARE WILLING TO GIVE IT A TRY?

Estimate are at 20,000 to 50,000 new users, everyday, with THOUSANDS of
those joining the actual Internet. Remember, play FAIRLY and HONESTLY and
this WILL WORK, I PROMISE YOU!!!!!! You just have to be honest. Make sure
you print this article out RIGHT NOW, also, Try to keep a list of everyone
that sends you money and always keep a eye on the newsgroups that everyone
is playing fairly. REMEMBER, HONESTY IS THE BEST POLICY. YOU DON"T NEED
TO CHEAT THE BASIC IDEA TO MAKE MONEY!!!!!! GOOD LUCK TO ALL AND PLEASE
PLAY FAIRLY AND YOU WILL GET A HUGE REWARD FROM THIS, WHICH IS TONS OF
EXTRA CASH!!!!!!!

**By the way, if you try to deceive people by posting the messages with
your name on the list and not send money to the peolpe already on the list
you will not get much. Someone I was told about did that and he only made
$150, and thats AFTER 7-8 weeks!!!!!!!! Then he sent the 5 $1 bills,
people added him to their lists, and in 4-5 weeks he had over $10,000.

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE
WEALTH OF THE WORLD WITH OUT COSTING ANYTHING BUT OUR
TIME!!!!!!!!!!!!!!

Tom and Brian,

I had the same problem with mine to. I figured out there is a maximum of 50 channels you can lock out on the radio, after that it start to unlock channels keeping the max at 50. This may be why you are seeing it unlock at a later time. Thats what was happening to me. Try only locking out that one channel, or no more than 50, and it should stay locked out for good!. I hope this helps, if not then there is a problem that's not ordinary for that or any radio

Good Luck!
John

If you can, all of us would be bowing down at your feet with gratitude! And yes you could use FFT for decoding. Their might be a DLL just for that purpose.
--
73's

Isaac Bentley (KD6TCV)
Painting@c-zone.net

I am interested in adding a decode feature to my recorder s/w but the concern I have with this is: does it take a lot of CPU to listen to samples for DTMF tones?

Would it be realistic to use an algorithm like FFT to perform the decoding?

: this for a handheld scanner?

: Thanx

Yes, just get some type of adapter and hook the coax up to the antenna
input on your scanner, and see what you can receive. The antenna will
receive frequencies in the 50Mhz-400Mhz range. One drawback is that TV
antennas like that are directional, you will have your best reception
from where the antenna is pointing and may not be able to rotate it.
Also, beware of lightning and disconnect the antenna during storms and
when you're not using it.

Lorin,
The '97 edition of Police Call Plus is available for
about $13. Do you really need it? No. Do radio licenses
get added and deleted every year? Yes. So if you really
want to keep up to date references then it's a good
price for this fine work.

I live in Omaha NE and work on Offutt AFB. The Souix City ANG does fly
F-16s. They are one of our most popular transient aircraft here at
Offutt. They do use the BAT callsign.

Line of sight from the top of your antenna to the top of the other guy's antenna.

> I live in Florida, so I don't have to worry about terrian blocking signals. <g>

Sure you do. The biggest one of 'em all..... the earth's curve.

>I'm wanting to pull in stations from about 45 miles away.

Take the height of your antenna in feet above ground; multiply it by 2. Then take the square root of that product for an estimate of the distance of your antenna to the horizon. Example: say it's at 30-ft. Twice that is 60, the square root of which is 7.75 miles.

If the other guys had a 30-ft antenna, then line of sight range between the two max's out at about 16.5 miles. If they are higher, then so much the better for you. If you can go higher, good. As you can see, it will take some doing to achieve a 45-mi range over "flat" land. You'll really need a directional beam antenna to reach way out there.....discones won't get it.

Ummmmmm.....the less visible an antenna, the less effective it will be.
The more metal in the air, the better.

There are antenna systems designed for the government that may be low
profile, but those will cost you an arm, leg, and a set of steel lugnuts.

Invisible antennas for the hobbyist at hobby prices will not be very
effective.....certainly no more effective than what you could make for
yourself at less money.

OK, here's the deal. I have an IBM ThinkPad 720 mono that is collecting dust.

The package I have includes: laptop (486/50, 12/240, all ext. ports, 1.44 floppy, 2 PCMCIA slots), AC adaptor/charger, 3 extra batteries, 2 extra 160mb hard drives, 2 docking stations (both with full set of ports, SCSI-2, 2 expansion slots, 5 1/4" drive bay. One has 2x IBM SCSI CD-ROM.), external battery charger, and hardshell carry case with handles and wheels. Everything

is in excellent condition. Current value on today's used market is about $1200 for everything. Would prefer to keep package together, buyer pays shipping.

What I would be willing to trade for: cash, BC 9000xlt, 2m/70cm handheld, AOR

AR8000, PRO26, PRO2006, BC 3000XLT, digital general coverage receiver, and possibly other items. Will accept combination of above or other arrangement to equal value of laptop and accessories.

Please email offers and questions. Thanks.

Yup - see below

>Could the polarity be reversed?>If so, how does one change it?

TTL/CMOS inverter?

>Tom N8GQK

Tom, I am not sure about the polarity but I do know that to decode
data, you must have a "relatively" pure squarewave. That is what the
schmitt triggger inteface is supposed to do BUT....

The circuits that I have seen for the interface are expecting to be
fed from the earpiece or extension speaker at voltage levels in the
region of about 2 VAC.

If you are feeding the interface from a discriminator output, then the
voltage levels will be much lower (0.5 - 0.7 vac ish)

The signals, even direct from a discriminator are not 100% pure and to
clean them up, (condition them) the input signal level to the schmidt
trigger is hyper critical - there is not very much latitude in the
levels - too little & you clip and insert false 1s and 0s, too much
and you start to "decode" the distortions nearer the crossover
points again introducing false 1s & 0s

One of the MAJOR problems that you have to over come is the SIGNAL
LEVEL.

If taking the signal from the earpiece/ext speaker, then you have
control over the level via the volume control BUT the audio amp (and
its filtering) in the radio buggers up the square wave often to the
extent that even the best schmidt trigger circuits will not restore
the wave shape.

Taking the signal from the discriminator gives you the best wave form available but it is at a fixed level! This level is also usually too low for the published interface circuits to cope with.

I cannot remember the actual mods to the published cct I did but I altered the grounding resister and feedback resister to make it far more sensitive (accept .25 - 1v) and then added a preset potentiometer to fix the level once I had established it.

This way I had total control over the levels. and got 90 - 95% decode consistantly

I do know that the circuit that is doing the rounds at the moment is a good one BUT it insensitive and the one that I built (all brand new components) did not trigger until 2.5 - 3 volts of audio were fed into it.

Considering that most hand helds only have a low powered audio stage, by the time 2 - 3 volts are fed from the audio stage, the third order harmonic distortions really make it pan out!

I will try and look out the cct and publish the mods that I did.

Bye for now...

>> HUH??? What does fuel have to do with reception?

Here - here...

>If it's very cold out, you need to give the car more gas to get it going.

...but seeing as you commented ...

Come on - get back to your physics books - Petrolium Spirit,... (Yanks call it gas, but it is not a gas - it is a liquid, but you know how they like to "improve" on our English language) (Instant WWlll) ...Petrollium Spirit when it is cold contracts.

: IE it occupies less physical space than when it is warmer.

The carb or fuel injectors will deliver the same VOLUME of liquid - therefore if the the amount of potential energy in that volume of liquid is greater cold that when warmer.

Therefore you should not need to feed as much fuel to the engine to get the same energy output when the fuel is cold especially once the engine is at its normal operating temperature.

If you have a preheater on you fuel line, then my theory is blown to hell and I take back what I said about you Wonderful, Kind, Helpful American Citizens!!! Yeah, I'm a coward!!!!

BTW: If you have a Volvo with an "Inter-cooler" that is designed to cool either the air or the fuel for the very purpose of getting more VOLUME of explosive fuel/air mixture into the engine... so SUCKS!

BTW: Cold weather CAN effect reception in a way that many do not realise. The coax outer sheath is a plastic which is not impervious to cold or UV (though manufactures say that it is not uv etc...)

The effects uf UV will cause micro cracks and embrittlement and will allow for the ingress of water. In the cold, water can freeze and remembering the physics, water expands when it becomes a solid! (ice)

This expansion will crack open the outer sheath even more and when the thaw comes even more water can get in.

This has several serious effect that costs money and can cause a reduction in reception (and transmission)

* the screening and centre conductors can and will corrode eventually erroding away causing open circuits and or higher resistance in the conductors..
* ice can crack or even break open the metal connectors causing open circuits or even short circuit the cable (You try listening to a signal with the coax shorted!)
* A damaged connector itself could be "dry jointish" and be ok when warm but open circuit when cold (cos it physically shrinks and expands!)
*Oxides produced by the chemical reactions of the breakdown of the various mettals in an aerial assembly will cause excessive resistance to the point of being an effective open circuit.

Then we can come on to the "Rusty Bolt" syndrome went it is acting like a rf powered diode multiplying local transmission freqs and mixing the with others producing crap interference up and down the bands... That is another subject for another time! But the rusty bolt is caused by weather!

So the answer to the original posters question:

Does cold weather effect reception?

YES IT CAN!

Bye for now!

I thought this was a news group for Radio Scanners.....It seems I've made a mistake. It seems to be a group for people trying to impress each other.....SEE YA !!!! Off to a group interesting in discussing issues related to scanning. My suggestion to all, interested in scanning, leave this GROUP!!!!!!!!!

I really like my Scout, I have gotten hits on every thing from radar traps to hot air balloons to traffic planes!

I used to have a 'regular' freq. counter and never found anything usefull. The Scout is well worth the money.

Gee, what were those decent comments re the RS discone and from where did they come? My advice to a new scanner user, forget the RS discone (its crap,though that's not a very scientific evaluation, though I had one and caused more rooftop terror than I care to remember) and spend a bit more money on a Diamond D130 discone. The construction is vastly supperior, solid as a rock through hurricane force winds and ice storms and the verticle element extends good reception to the lower frequencies. I liked mine so much I bought three more. You will not be disappointed.

I also recommend hooking it up to your scanner with RG6 coax, and couplers and everything else are available from Grove Enterprises. No, I don't work for Grove; just been there, done that.

Hope this helps.

Dear Scanner Friends:

I would like to introduce you to one of the best, nationwide, bi-monthly, all-scanner publications called, THE AMERICAN SCANNERGRAM. Published by the All Ohio Scanner Club (We're not just of OHIO anymore).

Read the 60-plus pages each issue with columns written by editors from the former NORTHEAST SCANNING NEWS, along with columnists from such publications as Monitoring Times, Popular Communications, & US Scanner News. In fact, many of our columnists have even authored some of the leading books in the radio hobby community.

We specialize in CTCSS (PL) tones and print a great many of them in each issue. With unbiased, tell it like it is, Book and Product Reviews. Past issues contained reviews of the AOR AR-8000, Opto Scout,Hoka, and many more.

We have reviewed books like "Monitoring The FEDS", "Scanner Master", "Washington-Baltimore Scanner Almanac", and others.

Read our review of the October 1996 Virgina Beach Hamfest. Or, join us at the 10th anual Winter SWL Fest in Kulpsville, PA... March 13th-15th, 1997 (For more info write : Winter SWL FEST, PO Box Colmar, PA 18915).

Learn all the "SNOOPER FREQUENCIES" (many that are either new or that you probably never knew about), that are banned by various new and old laws.

You wont see any one liners here!

Read the various feature columns each issue including: Beginner's Corner, U. S. Military, Federal Government, Marine, Computer Corner, Transportation, Utilites / business, Scanning Cyberspace, Scanning Europe, ANARC News& Notes, Aviation, Railroads, Sports, Special Topics, Antennas, Buy/Sell/Swap and many others. And, don't forget the TOP TEN LISTS!

Sammy The Scanner AIN'T HERE!

Most states have at least one state column editor, many states have more than one.

YOUR "ONE STOP" SCANNER SOURCE OF INFORMATION FOR THE U. S.

For more details:

1. See our WEB Page at: http://aosc.rpmdp.com.

2. E-mail AOSC at n8oay@bright.net

3. Post your name and address right here.

4. Or, write to at AOSC, 20 Philip Drive, New Carlisle, OH 45344-9108

HAPPY MONITORING!

If temperature did not affect gasoline, then they would not sell different
formulations for cold and hot weather. Cold weather fuel must be more
volatile to make up for the lower temps. So it is not just the volume
of fuel, its also the formulation that controls the horsepower and
anti-knock properties.
cheers

Now that many of todays scanners have the ability of storing up to 500 channels, I'm interested in hearing how others keep track of what you've entered in your scanner. Do you write this down or use a computer program to assist you? I'd like to see a feature on future scanners, and maybe it's already available on the more elite models, but one that would offer the ability, that when you entered a frequency in and if it was already in one of it's channels it would tell you. Your thoughts?

You know, I hate to sound like a know it all, but please take note.
For the 150th time on this newsgroup someone is recommending RG6 coax
for monitoring use. There are no monitors or antennas designed to
operate on 75 ohm cable. Communications equipment uses 50 ohm cable.
The antennas and the receivers are designed for 50 ohm cable. There
is a difference. If you want the best possible reception, use RG8 or
RG58 or some form of hardline cable designed to match 50 ohm
equipment. RG6 cable is great for TV antennas and matching networks
used in the video industry. IF Grove is recommending RG6 for
communications antennas, then I hope they are selling boost amps to
compensate for the loss in the mismatch. In my opinion, the reception
from a quality run of RG8 will do what the same length run of RG6 and
an amplifier will achieve.

The board layout & CCT to the CU8232 is proprietry and copyright to
AOR and should not be published. There are various other circuits
available on the 'net though Elko.

I sell a low cost interface for the AR8000/2700 radios as either a
full set of parts (with detailed instructions and drawings) for self
build or ready built and tested. I will email you privately all the
details.

Does anyone happen to know what frequencies the San Leandro (California) police use? According to a couple of (probably outdated) sources I've checked lately, they use 154.0-155.0MHz, but I've never heard anything on those frequencies (It's not just my location. I live in SL...actually sort of on a border where San Leandro, Castro Valley, and Hayward meet). I'm guessing they've moved to a trunked system in the 800 band. I occasionally hear a message that *sounds* like it's referring to SL at 868.4500MHz.

My other question is: Does anyone happen to know what 417.5750MHz is? From listening, it sounds like it's coming from San Francisco (they reference street names from SF anyway) and it seems like it might be a law enforcement agency, but which one? Isn't this in the federal band?

Nigel:
I have an older Radio Shack scanner that does not work well when it gets
cold out.
Electronic components have a range of temperature that they will opperate
within. Too cold or too hot, and they will not work correctly.
I suspect there is some component or components in my scanner that change
value enough to screw up my scanner when it is cold. After I get the heat
going, and it warms up in the car, it starts to work ok again.

Hope this helps,
Thomas

403. Houston PCS v. Cellular

404. GMRS and FRS frequencies shared?

Newsgroup: rec.radio.scanner
Date: 1997-01-05 00:00:00 UTC
From: "Robert H. Eisner" <rheisner@worldnet.att.net>
Message-ID: <32D00076.544A@worldnet.att.net>
Source record: 212945
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hi All,

I noticed that Radio Shack is selling a 10 Channel 2 Watt
GMRS radio that operates on the following frequencies:

Channel 1 462.5625
Channel 2 462.5875
Channel 3 462.6125
Channel 4 462.6375
Channel 5 462.6625
Channel 6 462.6875
Channel 7 462.7125
Channel 8 462.5750
Channel 9 462.6250
Channel 10 462.6750

The model number for the Unit is PRS-102 (not "F")

Channels 1 - 7 seem to be shared with FRS Channels 1 - 7 ???

I thought the GMRS Split frequencies were allocated to FRS only?

Bob

We had a 200XLT. When the battery finally died after several years of steady use the battery actually went OVER voltage instead of dropping off to zilch. Check your problem battery pack with a volt meter. If it goes too high a self protection circuit kicks in and the radio wont turn on. You may just need a new battery.

>That's your problem... Gotta ground that metal pole!

I disagree. Grounding has little to do with it. I use amateur radios
on VHF that are not grounded that work fine. VSWR 1:1. Perhaps you
have a bad plug on your coax. Did you put the plugs on yourself? There
may be a short. Almost anything will be better than a rubber duck even
a wire antenna. Even a long line feed with a good antenna should do
better than a rubber duck. If you have an OHM meter try checking the
coax.

How would you distinguish between another frequency in the spread spectrum communication and a completely unrelated cellular transmission? Wouldn't it be difficult to distinguish the difference between an analogue transmission and an encrypted transmission?

>> I would like to see someone try and beat the New CDMA technology.
>> There are quite a few levels of complexity built into the
>> this Standard. One of them is something called the " Long Code"
>> which is some 40days in length. The listener has to know exactly
>> where the user is in the sequence to de-correlate the DSSS
>> signal. Not to mention that the users ESN is mixed in a certain way
>> with this Long code PN Sequence to add to the complexity.

There seems like there's a loophole in this. What if a packet of information gets lost? There would have to be some verification of the id of the owner/position in data stream which would allow a listener to be able to decode it. Simply getting near enough the transmitter with the scanner might disrupt the transmission enough for a packet to get lost, and the a decoder might be able to crack the encryption, knowing what packet number the communication is at.

Any ideas?

Justin

Do you have information on Amateur Radio or other interesting items you might have picked up involving radio communications during the recent weather-related disasters in California, Oregon, Washing, Nevada or Idaho?

Heavy snow and ice storms collapsed buildings. Then, this was followed by warm rains, resulting is massive flooding and mud slides throughout the western U.S. Over 100,000 people have been evacuated in California. 20 roads remain closed in our county (in Washington) at this point, a week after the worst of the weather has passed by.

Any information you have on radio communications, and especially Amateur Radio Emergency Services (ARES) or Radio Amatuer Civil Emergency Service (RACES) functions is wanted for use at our web site.

Please visit http://www.hamradio-online.com - now read in 55 countries around the world.

I don't pretend to know it all either...I just try different things and see what works best for me. The RS discone didn't work for me so I moved on to what eventually did.

Same with coax. I heard it all about impedence mismatches and all that and I don't get into the tech stuff. Grove recommends RG6 due to its low loss capability and since for receiving only applications the mismatch doesn't mean a hill of beans. As I see it a scanner is like a TV and antenna in that it is designed to receive signals only, not transmit. I set up my first with quality RG8, then with RG6 and the difference was staggering with the latter giving me much more signal.I had no loss in signal which needed a boost due to loss from impedence mismatch and in fact I had signal gain. Now I have three Pro 2006 scanners hooked up to 2 discones (for general monitoring) and a gain Cushcraft 2 meter Ringo Ranger ham antenna for railroad band monitoring, and all with RG6. And I have the same discone and scanner base setup at work too for Coast Guard and natural resources monitoring, again with brilliant reception and no need for amps.

As far as I'm concerned, the Grove solution was the right one for me and I recommend it to others with similiar applications. When it gets down to the nitty gritty, sure it may not be the absolute best or conventional, but it worked and I went from a disgruntled scanner operator to a happy and content scanner operator.

The DEA doesn't have many aircraft of any type. Drug enforcement missions are often flown by the armed services in cooperation with DEA. (That used to be illegal, but I guess posse comitatus doesn't apply to the Drug War.)

I have both the PRO-26 and the AR8000. As far as ease of use and scanning
speed, the PRO-26 wins hands down. The AR8000 wins on features and
channel capacity. One feature that I really like about the PRO-26 over
the AR8000
is the capability to turn individual banks on and off during scanning. On
the AR8000
you have to "link" banks which I find cumbersome.

Another feature the PRO-26 has that the AR8000 lacks is a lock-out review.
This
allows you to quickly unlock channels that have been locked out. This is
very handy
when monitoring trunked systems with changing control channels.

Features I like on the AR8000 is the computer interface with which you can
download
frequencies from your computer and that capability to indentifiy channels
with up to
7 characters.

I have yet to decide which scanner I like best. Each has it's advantages
and weaknesses.
I don't think that you will go wrong with the PRO-26. I have not had any
problems.

The following scanners are for sale:

Pro-2006 - 400 ch. excellent condition with cellular mod done already
with box, manual and antenna. $285.00 incl shipping.
Pro-2022 - 200 ch. good condition with cellualar mod done with manual and
antenna. $150.00 incl shipping.
Pro-46 - 100 ch. hand held very good condition with box, manual and
antenna. Cellular is not done yet but receives them with
simple keypad entry.Can be modified for full cellular. $140.00
incl shipping.
AOR-2515 - Over 2000 channels made up by 62 scan banks of 32 ch each and
16 seperate search banks. All can be scanned at once or
however you wish. Full cellular coverage. Computer interface
and software for full computer control scanning.
Includes receiver, manual, antenna, computer interface cable,
software. Just came back from being tuned and checked over.
Excellent. $400.00.

Hey folks,

I appreciate the input on the BAT callsign, but take a look at the type of aircraft involved here - F-16 fighters. The DEA doesn't fly any F-16s!!!

Not the A-7s either, but it could be the same unit, if they've transitioned from the A-7s into F-16s recently. Can anyone tell me if the Souix City ANG is now flying Falcons?

>>Thinking of buying a Maxon GMRS 210+3.

And if you're interested in serious GMRS communications, then you should!

Written in late 1994:

FINALLY A RADIO DESIGNED SPECIFICALLY FOR THE G.M.R.S.
Clint Bradford

Maxon has just announced a new UHF transceiver designed exclusively for the GMRS, and which has USER FRIENDLY multiple-repeater capabilities. This model is not (like most other GMRS radios) merely a reworked version of some other commercial model. This one has features which are uniquely needed by GMRS licensees, especially those who travel.

10-channel positions -
Channels 1 through 7: the seven non-repeater "interstitial" frequencies (462 MHz only).
Channel 8: the 675 channel, user selectable from the front panel for EITHER repeater or direct communications.
Channels 9 and 10: dealer programmable for any 2 of the other 7 PRIMARY channels, also front-panel selectable for either repeater or direct communications.

With the front-panel repeater offset selection for channel positions 8 through 10, this could actually be considered to be a THIRTEEN-channel radio.

CTCSS tone-code selection: FRONT-PANEL USER SELECTABLE for ANY of the approximately three dozen common tones plus another dozen extended and "in-between" tones, fifty in all. The user can quickly change the tone code on any channel. The capability to change the code no longer requires access to internal programming or the use of a special external programmer. It's all accessible on the front panel.

Transmitter output power: Depending on the battery or power source, from 2 to 5 watts output, with a low-power (1 watt) front-panel selection.

This is the first UHF transceiver since the mid 1970's designed exclusively for the GMRS with a repeater capability. It is also the first GMRS radio EVER to include user-friendly, front-panel-accessible multiple CTCSS selection.

> ^
> | thats a zero

The control signals that change the hand-off frequency, registration,
signal strength, etc. are in a code called Manchester and transmitted
on 42 data channels.
A device that decodes them is the Digital Data Interpreter from Custom
Computer Services. They do not sell to the general public but now and
then you will see one advertised here.
Trunked radio is completely different.

The New CDMA Cellular Standard uses DSSS or Direct Sequence Spread
Spectrum all users share the same frequency or channel at the same
time. They are distinguished from each other by a Unique Digital
code.Also, the modulation used is not FM as in conventional Cellular,
it is QPSK. If you were to tune your scanner to a CDMA channel all
you would hear would be the hissing sound of noise.

>There seems like there's a loophole in this. What if a packet of

>encryption, knowing what packet number the communication is at.

There is quite a bit of messaging that qoes on between the Phone and
the Base station to take care of the data packets.Packet loss is not
that big of a deal at low rates. at high rates the voice quality will
suffer noticeably.

The RS discone generally speaking is not much better than an indoor antenna and does not cover the lower VHF bands. There is another RS antenna which sells for around $30 or maybe $40 but it is a huge sucker and takes up quite a bit of room. For a bit over $100 Icom makes the AH 7000 which is nearly identical to a Diamond antenna I believe the 130. It is a wonderful, sturdy discone that in the case of the Icom comes with 50 feet of coax although it has N connectors on each end for the Icom 7000 receiver. This is a nice wide range antenna that has held up nicely in the nastiest of Minnesota winter storms, blizzards, ice etc.

429. BNSF Stampede Pass Freq.

Newsgroup: rec.radio.scanner
Date: 1997-01-05 00:00:00 UTC
From: bd703@scn.org
Message-ID: <E3IHDp.Cr0@scn.org>
Source record: 212982

The Burlington Northern Santa Fe Railroad has reopened the Stampede
Pass line between Auburn and Ellensburg Wa.

There is still lots of work occuring on the line in addition to the frequent
snow removal operations.

The road freq for the Stampede subdivision is 161.250 mhz and trains and
work crews are talking to the " BNSF North Branch Dispatcher".

At present BNSF is operating a couple of trains each way per day. As weather
and track condition improve the number of daily trains sould increase.

Kerwin

430. Re: PACE 308 scanner

Newsgroup: rec.radio.scanner
Date: 1997-01-05 00:00:00 UTC
From: parnass@marconi.ih.lucent.com
Message-ID: <5an24d$f3j@ssbunews.ih.lucent.com>
Source record: 212983
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Circuit details for the Pace 308 and other models in
the series (108, 208) are covered in volumes SD-1 and SD-7 of
Howard Sams "Scanner-Monitor Servicing Data" book.
To purchase the servicing data, contact Howard Sams
Publishing division of Prentice-Hall at (800)428-7267.

A passage on the 308 says it "monitors all three bands
of frequencies (VHF-low, VHF-high, UHF) at one time. There
are special features designed into the SCAN 308 to provide
16 channel capacity with an 8 channel readout..."

"..Up to 16 different crystals may be installed at one ...
Eight crystals may be UHF and eight crystals may be any combination
of Hi or Lo VHF."

"The 3 position program switch on the rear will select the particular
crystal and band being heard in any one of the eight channel
readout positions. For instance, if in the two sockects
for channel 1 -

a. there is a 456.5 MHz crystal in the UHF #1 socket -
b. and a 156.5 MHz crystal in the VHF hi/lo #1 socket -

the operator would have the option of:

a. listening to 456.5 MHz on #1 by putting the back panel
switch to "UHF" (full up)
b. or listening to 156.5 MHz on #1 by putting the back
panel switc to "Hi" (middle position)
c. With the back panel switch #1 on "Lo" (full down) --
nothing will be heard on #1 -- unless the Hi VHF
crystal in socket #1 were changed to a Lo VHF
crystal.

This unique design technique provides 16 channel monitor
capability in a more compact case with capability of mobile
mounting as well as base operating features..."

436. "Tactical Box" vs. "Local Box" - Fire Dispatch

Newsgroup: rec.radio.scanner
Date: 1997-01-05 00:00:00 UTC
From: fjr3@enter.net
Message-ID: <32cf2827.440025@news.enter.net>
Source record: 212989

Does anyone know the difference between a tactical and a local box? I was listening to Bucks County, PA dispatch and they seem to use both tactical and local boxes interchangeably for fire calls. Their other boxes are rescue and marine.
Thanks in advance,
Fred

437. AEL multi-band mil spec. antenna

Recently acquired a CanForce mil. spec. multi-band comm. antenna
made by AEL in Penn. USA. Rises about 30' has beam elements marked
from 25 Mhz to 1.2 Ghz. Anyone know anything about this type of unit?

HIGH PERFORMANCE S-METER
FOR THE PRO-2006/5/4/3/2;-2035/2042
PRO-2027/2024/2022/2021/2020
PRO-62/44/43/39/37/36/34/32
and possibly other scanners with the 108-136 MHz Aero Band

==========

This article/file is for the public benefit.

(c) 1995-96 <All Rights Reserved> Bill Cheek-COMMtronics Engineering

This article/file is for personal use only and may NOT be placed on a
CD-ROM nor any other media that conveys, stores, or transports for
any monetary cost, without expressed permission of the author. This
article/file can only be given away, absolutely free of charge.

-Bill Cheek-

==========
PRELIMINARY NOTE: This article is self-contained and you really don't need
any other supporting materials other than the service manual for your
scanner. Bear in mind, however, that only so much detail can be in an ASCII
text file like this. If you want more detail than offered here, a hard-copy
laser printed version of this article, complete with professionally rendered
graphics (six of 'em!) is available for US$5.00, ppd. See my signature box
at the end of this article for addresses, phone numbers, etc.
==========

Many scanners are capable of supporting an easy to build and install
S-Meter! All Realistic scanners made by GRE-Japan with the civilian aero
band, 108-136 MHz, apparently can support this low cost, high performance
S-Meter modification.

It takes special circuitry for a scanner to receive Amplitude Modulated (AM)
signals because AM is an uncommon mode in the VHF/UHF spectrum. In fact, AM
is used pretty much exclusively for civilian aircraft comms on 108-136 MHz
and military aero comms on 225-400 MHz. Most scanner signals are Narrow FM
(NFM). Wide FM (WFM) is used in the FM Broadcast band, 88-108 MHz, TV audio
signals; and studio-transmitter-links. Everything else is pretty much NFM.

Therefore, most scanners are designed strictly with NFM in mind, and will
not have either AM or WFM capability except as a costlier extra feature.
Thatï¿½s why you pay more for scanners that have the civilian aero band, and
more still for those with the military aero band.

If your Realistic scanner has the AM mode, and it will, if it has the civilian aero band, then chances are good that we can take advantage of its extra circuitry to add the simple, low cost S-metering function.

Scanners known or strongly thought to be capable of this easy S-Meter mod include the following listed in Table 1:

TABLE 1: COMPATIBLE SCANNERS FOR THIS S-METER MOD

PRO-2042 PRO-2027 PRO-43
PRO-2035 PRO-2024 PRO-39
PRO-2006 PRO-2022 PRO-37
PRO-2005 PRO-2021 PRO-36
PRO-2004 PRO-2020 PRO-34
PRO-2003 PRO-62 PRO-32
PRO-2002 PRO-44

CAVEAT: Radio Shack had many of its later scanners made by Uniden, the design of which leaves so much to be desired that this version of the S-Meter is probably not feasible. There are other alternatives but are beyond the scope of this document.

If your scanner is not listed in Table 1, the best way to determine applicability of this procedure to your scanner is to review the main schematic diagram for your receiver section, and compare it to the circuit of IC-2, Q-12, Q-13, and D-33 of the PRO-2006. This circuit is used in all the above compatible scanners, and is required for this version of my S-Meter mod. Specifically, you will look for the NFM chip and AM diode shown in Table 2 further below.

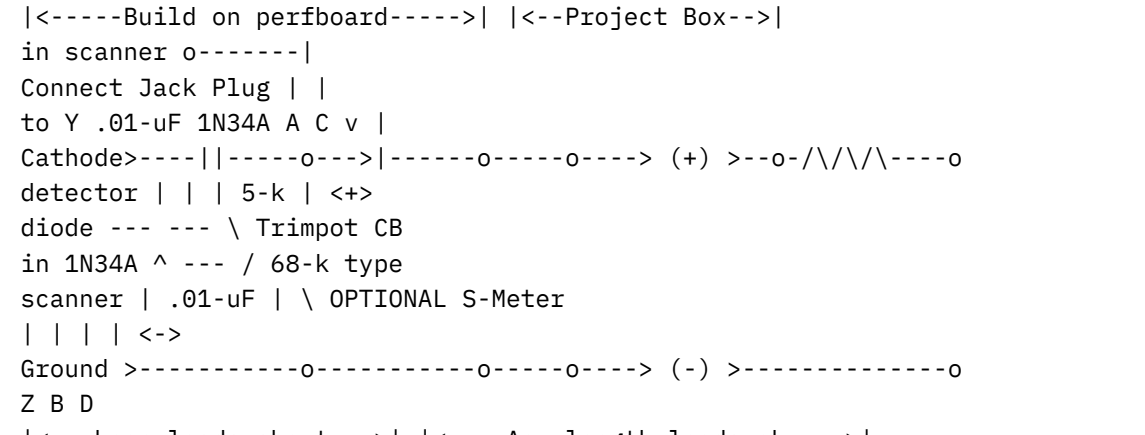
The AM section of the PRO-2006 is almost identical to the AM circuits for the scanners listed in Table 1. Each of these scanners takes its AM signal from the output of the 455 kHz IF filter thatï¿½s attached to the NFM Discriminator chip. Part of the IF signal goes back into the NFM chip for NFM signals as needed. The other leg of this "Y" is that part of the signal that goes on to a separate AM processor. The key thing here is that both circuits are used full time. Special switch circuits do the controlling of which mode is actually in use, but the circuits are on full-time. Thatï¿½s why we are able to use the AM circuit to power our S-Meter

The key point here is that you must identify and use the cathode of the AM Detector Diode as the pickoff point for your S-Meter signal. If your scanner is capable of this mod, it will have an AM circuit almost identical to that of the PRO-2006. Find it, and then locate the AM detector diode. The diodeï¿½s banded end is the cathode where the S-Meter signal will be tapped.

For base scanners, build the simple circuit in Fig-1 on a bit of perfboard. For handheld scanners where space is at a premium, it may be best to not use a board, and just build the circuit of Fig-1 directly into the scanner, part by part. Start by soldering C1 to the cathode of the AM detector diode, and the anode of D1 to a handy ground. Then build the rest of the circuit around those two components. Following is Fig-1, the schematic of the S-Meter circuit.

Build the following simple circuit left of Points A and B on a piece
of perfboard. The circuit to the right of A and B is optional,
explained further below.

FIGURE 1: SCHEMATIC DIAGRAMS



THE PARTS: Radio Shack stocks the parts shown in Fig-1 except for the
S-Meter. Diodes must be germanium, 1N34A or 1N60. Capacitors should be
ceramic disks. Resistor (56k-100k) and trim-pot (3k-10k) are not critical.
The circuit of Fig-1 must be as shown. If you use an external CB-type
S-meter, so much the better....just build the meter of choice into an
attractive or functional project box with a cable of any length from the box
to Points C and D which should be wired to a male phono plug of some sort.

Most any analog CB-type S-Meter is ideal for this project, but the larger
the face, the more readable it will be. There are thousands of junked CB
rigs all over the planet, and most any CB or radio shop will have a bin full
of them. The cost of a salvaged S-Meter should be negligible.

The scanner should have a mating female jack connected to Points A & B,
installed in an out-of-the-way place for the plug from the external meter.

Connect Point Y of the S-Meter circuit via a very short wire to the cathode
of:

TABLE 2: CONNECTION POINTS IN VARIOUS SCANNERS

SCANNER	DIODE	AM -near- NFM CHIP
PRO-2042:	D-34	TK-10420
PRO-2035:	D-34	TK-10420
PRO-2006:	D-33	TK-10420
PRO-2005:	D-33	TK-10420
PRO-2004:	D-31	TK-10420
PRO-2003:	D-122	MC-3357P
PRO-2002:	D-119	MC-3357P
PRO-2027:	D-24	MC-3361N
PRO-2024:	D-24	MC-3361N
PRO-2022:	D-29	MC-3361N

PRO-2021: D-24 TK-10420
PRO-2020: D-120 MC-3357P
PRO-62: D-302 MC-3361N
PRO-44: D-202 MC-3361N
PRO-43: D-302 TK-10420 or 7
PRO-39 D-202 MC-3361N
PRO-37: D-122 TK-10420
PRO-36: D-114 TK-10420
PRO-34: D-117 TK-10420
PRO-32: D-122 TK-10420

Keep the Point Y lead length very short, not more than an inch.

Connect Point Z to scanner PCB or chassis ground and keep that lead short, not more than 1 inch.

Other Scanners: This mod may work with other scanners that have the civilian aero band of 108-136 MHz. If your scanner has 108-136 MHz and is not listed above, then find the last 455 kHz IF section, and locate the AM detector. Connect Point Y to the cathode or IF-side of the AM detector.

==========
NOTE: While this mod probably woni¿½t work with Uniden scanners nor Radio Shack scanners made by Uniden, a little R&D and experimenting on a Uniden aero-band scanner could prove successful. I doni¿½t own any Uniden scanners, but can assist you in your R&D if and only if you and I both have a copy of the service manual for your scanner. Contact me by e-mail if interested.
==========

WRAP-UP DETAILS: Points A and B are the metering points where any DC voltmeter can be used. S-Meter signal range will be about 0-1v. The circuit of C and D is an optional CB type S-Meter, and should be used external to the scanner. Therefore, it is ideal to wire A and B (length not critical) to a phono jack on the rear panel of the scanner for easy connection of the external meter. Use 1/8" or RCA phone jacks for base scanners and 3/32" submini phone jacks for handhelds.

METER CALIBRATION: Any DC voltmeter can be used directly at A and B including a bargraph LED display. If an external S-meter circuit is desired, then wire it as shown. Use a walkie talkie or other transmitter to send a strong signal into the scanner, and adjust the 5-k trimpot so that the meter reads exactly full scale. All other signals will then read proportionally lower. Too cool for words!

METER LIGHTING: You can embellish your S-Meter with a small pilot lamp behind it to illuminate the face. Many CB meters have such a lamp built into the body of the meter. You may have to tap 12-volts or other power from the scanner for the lamp, or provide external power, like for handhelds.

SUPPORT: I cannot and do not supply S-meters. I can provide other parts including printed circuit boards, assembled or as a kit. I will provide technical support of this project on the public network forums and/or by

e-mail; never by phone. See the beginning of this article if you need a hard copy version of this article.

MOD BOARD INSTALLATION HINTS: Most modification circuit boards really need no special effort in the mechanical installation. I used to use fancy standoffs, bushings, and machine screws, nuts, and bolts, but no more, considering all my mods!

Now I loop a stiff #18-ga copper wire (RS# 278-1217) through a pair of ground holes in my perfboard or printed circuit; solder it securely to the board; and then solder it to a ground on the main board.

I solder the #18-ga wire to a chassis sidewall, or in some cases, to a ground foil on the main receiver board. This mount is rigid, safe, and easy, not only to install, but also to remove if needed. A "glop" of hot-glue on the bottom of the mod board prevents accidental shorts below it.

Enjoy S-metering at its finest!

441. AOR8000 vs MVT-7100

Newsgroup: rec.radio.scanner
Date: 1997-01-05 00:00:00 UTC
From: darkmtr@intex.net
Message-ID: <32d530cf.91059552@nntp.intex.net>
Source record: 212994
Cross-posted to: rec.radio.scanner,alt.radio.scanner

What are the practical advantages of the programmability of the AOR8000?

What is the difference in reception between the two scanners? I've heard that the AOR8000 has poor image rejection, but also that the MVT-7100 has bad noise problems near electronic equipment. Does anyone have an oppinion about which is more noticable/bothersome? I live in Dallas, TX, and is one of the scanners better in a city environment?

Thanks,
Justin

I bought a scanner about a month ago. I wasn't satisfied with the crappy stock antenna that came with it, so I bought a Rat Shack indoor antenna. It improved the range of my scanner a little, but now I want something a lot better. I'm thinking about a Rat Shack discone, since I've heard decent comments about it.

Unfortunately, I know nothing about putting up an outdoor antenna. Could someone give some tips to an antenna newbie?

I'd be kind of pissed if I got a $600 scanner and it came with a 20
page manual. But that's just me... Why would anyone spend $600 on a
scanner if they aren't willing learn alot about it?

>2) They decide the really didn't want to pay $600 for a scanner.

why'd they spend that much? There are better ways to blow a hundred
dollars than buy a scanner and then have to sell it.

>Jeff
>sgross@midusa.net

When Radio Shack decides to blow out their remaining stock of a
particular item they usually substantially reduce the price.
Sometimes it's a good deal, sometimes not. If the reduced item is
just what you were looking for and R.S.'s sale price is cheaper than a
comparable item elsewhere than it's a good deal.

I would advise against buying their extended warranty and insist on a
new item in a sealed box. They often sell returned and demo stock as
new and shuffle inventory between stores. There is *usually* nothing
wrong with the merchandise and it does carry the same warranty as a
new item. Beware that their warranty gives them the option of
repairing *or* replacing an item and often the item will be impossible
to replace because they've blown out all of their inventory. Some of
their repair centers are excellent, some are not. As has been pointed
out in this newsgroup, they don't stock parts for most products that
have been discontinued over 5 years or so.

I just bought one of their Pro 28s at the blowout price of $79.99
because I had been looking for a cheap handheld to use while out of
the house. I had no idealistic expectations, I knew what I was
buying; it's virtually unmodifiable and has an upper limit of 512 MHz
and no Aircraft Band. It's adequate for my purposes here in the
hinterlands but for many people it wouldn't be.

If they're flying F-16s, search 30-88MHz/118-144 (probably mostly
138-144), 148-151, and 225-400MHz.

You're looking for the flight 'intercom' channel -- a discrete channel
the pilots use for air/air tactical messages & BS'ing amongst
themselves, while using UHF to work the ATC stuff.

No matter what they're flying, a good way to get a lot of freq/channel
breakdown info is by snopping around the cockpit areas for that info
during base open-houses/air shows.

SC150 - $185
BC9000XLT - $399
MAXON GMRS210+3 - $195
I also have many other models on sale - if you are interested please let me know! Delivery is usually 3-7 DAYS depending on where you are. MC and VISA accepted over the phone only!!! I do not like exchanging that information over the net (for YOUR protection)!
Any questions?

No it is not legal to use a scanner in SA at least to listen to the
police frquencies that are in the 400 - 425 mHz range.

Local fire and municiple police are around the 150 -160 mHz range.

Cordless phones are in the 36 - 38mHz range but are normally very low
powered so have to have someone transmiting nearby.

459. A new user...

Source record: 213012

I am interested in buying a scanner, but I have no idea where to start. If anyone can offer me some advice, I would be most appreciative. I have a few questions....

Is it possible to receive mobile telephones?
Analogue?
Digital?
What about emergency services ie police, ambulance, fire etc?
What other types of services are readily receivable?
What about ham radio?
Do I need a radio with all modes ie SSB, AM & FM?
Do I need some kind of fine tuning to be able to resolve SSB easily, or can a main VFO dial suffice?
Do I need both USB & LSB?
What frequency range do I need?

Can anyone heartily recommend a scanner that will do what I want?

Is there some kind of helpful reference available on the Internet that will answer my questons? Or any scanner company home pages?

I am quite a novice so any and all information will be greedily consumed. I thank you all in advance.

Please reply via email.

Cheers,
Brad

Nick,
It's a very nice radio. Be advised that you get the
radio(which comes with a ni-cad) and an external charger
and extra ni-cad.
The $238 price is not bad although I have seen $210 -
$220 as the best price these days.

As others have said, you can but baby monitors at thrift shops for a
few bucks. But if you really want to build one, here is the info you
need:

Motorola makes a single chip 46 - 49 MHz transmitter which requires
only about a dozen other components. Schematic and parts list is in
the Motorola Telecommunications Device Data Book, publication DL-136
revision 2.
Don't know if it is still free.

Justin,
The AR8000 and MVT-7100 are both very nice units. The
AR8000 is noted for a top-notch receiver and almost every
bell and whistle you could ask for. The MVT-7100 is noted
for being about the best receiver you can get in the
handheld market these days.
Prices for a new AR8000 will run in the $550 to $600
range. The 7100 can be had for about $450. It's predecessor,
the 7200, is probably around the mid $500s.
The bandscope feature of the 8000 is always centered
around a specified VFO frequency. It covers that frequency
plus the 5 frequency steps to either side of it.

Hi John,

I did some research and he's right! The GMRS interstitial frequencies
are shared with FRS Channels 1 - 7. More info on FRS can be found at
the following URL:

http://home.navisoft.com/nspi/frs.html

Bob

> start. If anyone can offer me some advice, I would be most
> appreciative. I have a few questions....

Certainly.....find yourself a good newsagent/magazine store and pick up a copy of on of the magazines dedicated to the hobby. I haven't bought any in ages but would recommend Popular Communications and Monitoring Times. Not necessarily for the articles, but more for the advertisements. (Isn't this why we buy magazines?<G>) Scanners are very accessible at Radio Shack too - although you can usually find as good or better deals elsewhere, IMO.

> Is it possible to receive mobile telephones?
Cellular - with some difficulty in the US as no new scanners have provisions for receiving cellular telephones.

> Analogue?
As in MTS or IMTS? Yes, no problem here.

> Digital?
Not on a hobbyists budget, sorry.

Cordless? Yes, little problem here.

> What about emergency services ie police, ambulance, fire etc?

Absolutely!

> What other types of services are readily receivable?

Anything that has a radio in it can be intercepted. If you like to listen to Taxi drivers you can do that too. If you like to listen to voice-pagers, security officers, movie film crews and SWAT teams, you can do that too!

> What about ham radio?

Yes. Typically the 2m, 440MHz and 6m bands offer some listening. And often an incentive to get on the air with amateur radio. I've found in that last few years that the technical knowledge of your typical 2m ham has really waned.

> Do I need a radio with all modes ie SSB, AM & FM?

SSB is of little use on a VHF-UHF scanner. AM is useful only for aircraft reception.

> Do I need some kind of fine tuning to be able to resolve SSB easily,
> or can a main VFO dial suffice?
> Do I need both USB & LSB?

IMO, SSB is only an issue if you are planning on listening to Short Wave.

> What frequency range do I need?

25MHz to 1.3GHz is a good yardstick. IMO, if you want to monitor below 30MHZ you should purchase a receiver that covers only from 100KHz up to 30MHz.

> Is there some kind of helpful reference available on the Internet that
> will answer my questons? Or any scanner company home pages?

Yes! I would suggest that you read the articles that Bob Parnass posts on this group - and quoted elswhere on the 'Net. Just do a search on "Bob Parnass" and you'll get some excellent leads on much information.

> I am quite a novice so any and all information will be greedily
> consumed. I thank you all in advance.

It's my pleasure. Scanning means different things to different people. Some people get a real charge out of listening to one particular thing. Others like to listen to the emergency services. Folks like me like to listen to pretty much anything and to also tinker around with the electronics inside (and outside) of scanners.

Cheers!

This is a 7 transistor am radio. It uses a 2 cell, eveready"E640"
or Mallory "RM-640" or EQ..

The radio only messures 1 7/8" x 3/4". The ear phone plug has
2 plugs instead of 1.

How can I power it to see if they work. I have 4 of them.

Peace

A frequency counter is an accurate tool for reading frequencys. They
come in many flavors. Look for the January/97 issue of Popular
Communications. It has a great incert from Optoelectronics. A complete
line of Frequency counters.

In the city, transmitters are frequently located on top of tall
buildings or other structures (elevated water towers etc.) Also
traveling over water will increase the range.

I'm pretty sure thats the DEA! Probally one of there under cover
units....sometime I hear them around here....usally they are discrete
but some times they give there selfs away.
I went and watched a drug bust once (from a good distance) when I heard
them give the location and what they were doing.

Wa-hey!

I'm looking into purchasing my first scanner and I have a lot ov questions before I go out and buy it - I want to make sure I buy something that I'll be able able to use, not just a cheap-o piece ov techno that I'll out-use in 6 months. So, if anyone would like to answer some questions etc., you help would be most appreciated!

I'll definitly want a portable scanner - that's a must, but I also want to be able to hook up thee scanner into my sterio (through thee tuner) so I can broadcast it out via my speakers. I don't think this will take much aside from it having an output jack such as one for headphones 'cause I have thee connection wires to do that (I had to do it with my walkman once). I'd also like to be able to record portable (ie. while on thee road) but I also imagine this won't be much ov a problem aside from getting thee right recording equipment?

Anyways, so those are my needs. Now, thee question - where to get such a scanner, and roughly how much in price? I have no clue where to buy a scanner, or how much they cost so those questions are pretty important I guess.

I have tons more questions (like, is there a good scanning web page? and such) so if anyone would like to e-mail me private it would be most appreciated!

Takk,
Kristin

486. Strength of Scout with DB32 Antenna?

Newsgroup: rec.radio.scanner
Date: 1997-01-06 00:00:00 UTC
From: Chris Evans <woody@eudaemon.com>
Message-ID: <01bbfc61.6c7a4400$334db3cd@jerky.eudaemon.com>
Source record: 212789
Cross-posted to: alt.radio.scanner,rec.radio.scanner

So I got myself an Opto Scout with the DB32 miniantenna and I must say I'm not impressed with its performance. It doesn't even pick up my housemate's cordless phone unless it's in the same room. It does manage to pick up some cell phones while I'm cruising around in my car but sometimes I'll be right next to someone who's on a cell phone and it wont pick it up. What can I do to increase its range?

I'm looking mainly for the most portable solution for instances when I'm away from home or car because I plan on getting mounted antennas for those cases. But when I'm at sporting events and such, I'd like to have confidence in my gear.

If anyone has any suggestions on mounted antennas, I'd like to hear those as well.

Thanks!

487. Best auto and home antennas?

I have an AR8000 handheld scanner and an Opto Scout. I assume these units can share the same antenna simultaneously, no? I'm looking for the best mobile antenna for my car and the best antenna for home use. Also a few tips on what sort of doodads I need to connect both units to one antenna (including cables) would be most helpful as I am a lowly beginner. I want to pick up everything broadcast within 500 miles! Well, within reason of course. I just want to pick up the good stuff around town.

Thanks!

http://www.acecomms.com/Scanns/lookup.htm is just a form that sucks info from the PerCom Corp's Spectrum online database that's been around for quite some time (take a look at the HTML source). The official page is http://www.perconcorp.com/Db_srch.htm

In fact I'm not real sure PerCon Corp would be too pleased with the acecomms page since I couldn't find any mention that the database was actually PerCon's.

Bat followed by numbers has been used by fighter piulots since the Nam.
One of the sky pilots even wrote a book about being shot down. Used his
radio call as the title " Bat 21". Bat is also often used in the Fire
Service as short for Battilion Chief. There are many meanings for BAT
so keep searching. Larry..

>better than a rubber duck. If you have an OHM meter try checking the
>coax.

After rewiring the BNC connector several times, I replaced the R-58 wire itself
and the antenna finally works. I would not have thought a brand new cable
could be bad. I am now looking into putting a R- 8 cable to see if I can
further improve reception. I cannot shorten length of cable. The 50' length
is not as long as it seems. 10' up the mast, 20' up the roof, 10' down the
wall, and another 6 to 8' into the room.
I can now clearly recieve air bands, which I could barely do before.
Police bands seem unaffected, I guess since it was already good to begin with.
Cell is slightly better also. The antenna seemed to help the lower bands the
most! I am still pondering the idea of a better antenna.

Robert,
The Pro-26 is a fine scanner as is it's sibling the BC3000XLT.
You should look over the BC3000 to see if you'd like the extra
channels(400). And unless you get a sale from Radio Shack, you're
better off ordering the Pro-26(or BC3000) mail order...$350
delivered to your doorstep.
Good luck!

Strong signals,
Rich Wells

Thanks for everyone's suggestions. I did open it up and poke around, checked for obvious damage, etc. I twisted the whole unit pretty hard and I don't know exactly what happened, but while I was probing around with the back cover off the unit suddenly turned on. Wish I could report to others exactly what was wrong, but I suspect it was related to the battery supply contacts or something in that area. I was almost ready to give up, left it partially disassembled here on my desk for a week or so and was about ready to return it to Uniden for repair. Thanks again.

Nigel,

What you say is true, but the temperature ranges of electronic components are generally so wide, that the average winter or summer temperatures would not unduly effect the workings. (an lcd might get very sluggish when below zero of go black when very hot) but that is about all (I am not taking of true arctic conditions but the average Europe/American (excluding Alaska!) (there will always be the rare exception to the rule though!)

Most components will be ok even at above the boiling point of water....or below freezing point

A few days ago in temperature of minus 10 celceus (about 5 dec f?) one radio i had a look at failed to switch on because the small spot of grease that the manufacturer used on the pivit arm on the switch blade had frozen it to the poing that the spring was not strong enough ti shift the viscous stuff. It was a mechanical failure rather than an electronic one!

High reliability components are ordinary components that have been "cooked" at 125 deg farenheit for 96 hours or more etc.

>I suspect there is some component or components in my scanner that change
>value enough to screw up my scanner when it is cold. After I get the heat
>going, and it warms up in the car, it starts to work ok again.

This sounds very much like a "dry joint" within the radio. A dry joint is easy to fix, it often takes a while to find it though.

A dry joint is where a component lead was either poorly soldered, or over a period of time, due to expansion and contraction, the solder surrounding the lead has cracked in a ring around the lead and it is no longer making a reliable contact to the printed cuircuit board.

When the radio is cold, the joints contract, making the dry joint go open circuit. When the radio warms up the joint expands and makes contact.

Sometimes a dry joint is easy to see but mostly it is such a fine crack, it is almost impossible to see it with the naked eye.

If you have a fine tipped soldering iron, there is a way that you may be able to fix it yourself, but only if you feel confident in "having a go"

You follow the following at your own risk:-

(Please forgive, but I must assume that you have little or no experience with the innards of a radio.)

WARNING TO OTHERS: DO NOT TRY THIS IF YOUR RADIO IS AC POWERED

If you are not ABSOLUTELY sure about what you are doing, then take the radio into a repair shop.

Take the covers of the radio so that you can see all the electronic components. Some components will have tiny screwdriver slots in them - DO NOT BE TEMPTED TO HAVE A TWIDDLE! You could off tune circuits to the point of degredating the reception or even stopping the radio operating at all!

Get an insulated (non metalic) probe such as a wooden match or a plastic rod of a similar dimention and with the radio switched on, gently "wiggle" each component in turn. When you "wiggle" the one with the dry joint, you will recognise it by the behaviour of the radio!

Once you have identified which component has the dry joint, switch the radio off. See if you can actually see the lead with the dry joint - if not, try very carefully to "re wet" all the joints of that component with the soldering iron and a very small amount of fluxed solder.

Be careful not to spread the solder over to an ajacent track or joint!

I hope that helps....

If you are not happy to have a go yourself - then it would be worth taking it to a repair shop - often a dry-joint repair only takes half an hour or less so it could be an inexpensive repair. Ask the repairman for an approximate cost first, to be on the safe side.

regards

I recently had a chance to see the Monitor America Idaho section, which consisted of all of about 6 pages. I already have many of the frequencies listed in this section, but there were some that I did not have. I cannot justify spending $39.95 for six pages of frequencies (of which I already have 85%).

Would anyone who has the latest version of this book be willing to share (or sell?) a copy of the Idaho listings from Monitor America? Perhaps you could scan the pages in and e-mail them? or I could send you postage and a fee for your copying?

BTW, any other Idaho scanning fans?

Interesting. I'm pretty sure it's not USGS anymore. Whoever's using it
keeps calling in license plate numbers and there's an occasional reference
to "suspects". Seems like it's coming from a base of some kind in San
Francisco, though. There's a lot of references to a commisary (e.g. "I'm
down by the commisary now...") and to street names and areas I recognize
as being SF. Guess I'll have to keep listening to figure it out.

Eric:

I ran into the same dilemma when I decided to put a scanner in my car. The neighborhood had been hit with a rash of "Thefts from Auto" and it seemed that the thieves were targeting cars with antennas hanging out all over them. I wanted to mount the scanner in the car and also mount an antenna in such a way that it wouldn't be obvious. Here is what I did:

First of all, my car is a sedan - 96 Honda Civic Si Coupe. I had all three rear windows tinted and then went to Radio Shack and purchased a female BNC chassis mount connector. I drilled a hole in the rear deck, right beside the child seat anchor and mounted the BNC chassis connector there. I ran the coax thru the trunk and under the carpet to where I had concealed the scanner. This worked GREAT. I was able to use the antennas from my handheld scanner in my car. I didn't have to worry about someone bumping it when they rode in the backseat because the antenna is flexible. If I wanted a little more range, I attached the telescopic BNC antenna. The metal of the rear deck acts as a ground plane and the reception was good. This also keeps the antenna out of the elements and you don't have to worry about knocking it off when your sweeping two feet of snow off of your car.

I wouldn't say that this is the best solution, however, it worked for me. I haven't tried using it for TX though, I'm sure it wouldn't handle the 50 watts that my mobile puts out. Hope this helps.

>>discontinuing?

{snip}

They were discontinued and replaced with the 2045 which is the same
radio with some firmware changes. The 2035's are great radios,
especially at that price.

I bought two. Actually I bought one, then had a small "mishap" while
putting in a demod jack, so I bought another. I can eat ramen for a
while.

Anyway, I turned out to be better at microsoldering than I thought, and
I am one piece away from fising the one I broke. As soon as the 455 KHz
coil I drilled through (along with several capacitors) comes in all I
have to do is replace it and viola! (I hope)

it?

mine never worked right with Hamcomm or JVFAX, but it works with 100%
accuracy with PD. Maybe we should combine the two! :-)

You might want to make sure the audio level going into the interface is
correct. Does it work through the speaker output better?

Also, did you put a small capacitor between the baseband audio output
and the interface? It might help to filter out some noise.

I just purchased a PRO-26, and am pretty sure I'm going to return
it to purchase an AR8000. Before I do so, I'd like time to evaluate the
performance of the PRO-26 with a better antenna than what came with it.
Can anyone recommend one I can pickup at Radio Shack to improve
performance?

521. Re: "Tactical Box" vs. "Local Box" - Fire Dispatch

Newsgroup: rec.radio.scanner
Date: 1997-01-06 00:00:00 UTC
From: "Michael D. Madden Jr." <madden_michael@prc.com>
Message-ID: <01bbfc0a$b1cb8c00$7e21bc8c@madden.westcon.prc.com>
Source record: 212851

A Local Box is a 'Nuisance' call such as an alarm system, assisting the police, assisting the squad, fuel spill, etc. The call is still responded to as if it were a full blown emergency unless dispatch calls it a reduced speed response.

A Rescue Box is pretty obvious-- An auto extrication, a confined space rescue, etc.

A Marine Box is also obvious as it involves a lake , creek, or river, etc.

A Tactical Box is the next step up-it involves a dwelling fire, a store fire, a restaurant fire (depending on the size) usually any medium size building (under 10000 sq. ft???) is a tactical box and usually only when the caller or witness can confirm the sight or smell of smoke or the sight of fire.

A Box is the big-boy. This is for very large buildings such a warehouses, a lg. dept store such as K-Mart, a hotel, an apartment complex, a shopping mall, etc. and again only when the threat is real. An apartment complex alarm system would be considered a local box until confirmed.

Hope that answers your question.

Source record: 212854

May main point is about the reception capabilities of the AOR AR2700, are they really crap or what? A firend of mine bought a cheap Realiostic scanner with frequency gaps and othe such handicaps, we put

the two head to head against each other and his was picking up stuff no problem whilst I was struggling to hear it with the squelch turned right down, it rather put mine to shame, the received audio on his was nice and clear with no backround hiss whilst mine was noisy and irritating.

Haveing never owned a scanner before you just assume that what you are

receiving is OK and the same as everbody elses. I must admit I felt quite stupid because I gave my friend the same advice I had been given

when I was purchasing a scanner, you know the stuff aboutif you buy a cheap scanner you'll miss out on so much and you get what you pay for etc, it seems like it was all rubbish and he has got the better deal.

Is my scanner faulty or set up incorrectly and if so can I re-set it or try and improve reception in other way's. Suggestions of throwing it in the bin and starting again have already been made.

Any help would be greatly appreciated.

Brad,
The type of scanner/receiver you get will depend on what
type of services you want to listen to. The wider the frequency range
and more modes(FM/AM/SSB/etc) you get the
more it's going to cost.
You could start with a moderately priced scanner like
the BC230XLT which is dual conversion and covers quite a bit
of the range from 25MHz-1GHz. This will give you AM and FM
police, fire, EMS, ham, aircraft and business bands. This
radio will run you less than $250.
You could then work up to a triple-conversion rig with
more features and wider coverage like the BC3000 or Pro-26.
These run in the $350-$400 range.

If you want to delve into HF(below 25MHz), then you'll
need a dedicated HF rig(for better reception) or buy a
radio that can tune this range(not as well as a dedicated HF rig) and
offers you SSB options. These include the Icom, AORs and Yupiterus and
sell for between $450 and $600.
As for analog/digital, most of the radios you will be
interested in will be for analog/voice communications. You'll
have to buy a radio that can be connected to your computer
or other peripheral to make sense of any digital-type communi-
cations.
For mobile phones, you'll have to buy a used radio that
has, or can be, modified to receive these frequencies since
they have been deemed taboo by the FCC these days. Or you
can buy from a Canadian or Euorpean dealer who can sell you a
non-US, and therefor, non-blocked cellular frequency coverage
radio.
You should also decide how much you're going to sink into
this hobby. You don't want to spend a lot of money on a radio
that's gonna be collecting dust 3 months from now.
Do yourself a favor and
1) Pick up a copy of Police Call Plus at your local Radio
Shack. Lots of good info that will get you started from
the ground up.
2) Go to the DejaNews page and search for "Parnass". You
should see a series of "How to" articles that Bob posts
from time to time and should help answer many of your
questions on radios.
3) Go to a large bookstore in your area and check out their
technical/electronics section. Most of the bigger stores
carry one or two books on scanners/scanning and can
help answer many of your questions.
Feel free to contact me and I'll do my best to help you
out or point you in the right direction hopefully!
Good luck!

Source record: 212861
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,rec.radio.amateur.misc,rec.radio.amateur.equipment

The difference in the Mods are as follows:

The yellow wire mod will open up the recieve from 140 - 165 Mhz. This is acomplished by using the 2 meter bandpass filter. The rig will loose most of its sensitivity in the 60 - 140 Mhz Range. (6meters is not affected). By cutting the yellow wire you are leaving the 2 meter bandpass filter in place of the genral VHF bandpass filter.

Removing the caps mod actully corrects the existing badpass filter which now cuts out at 140 MHz to keep pager intermod out of the Broadcast FM.

By doing the caps mod opposd to the wire mod you get your full 60 - 180 Mhz coverage and have to live with some intermod in the FM BC and aviation bands (108 - 136).

The yellow wire mod is very easy and quick to get the VHF public service bands 148 - 165 Hhz but will kill most sensitivity in the FM BC and aircraft bands.

I hope this answers your questions

73,
Bill WD2AEV

Uh... he doesn't mean the interstitial freqs. He meant the
primary frequencies. The frequencies he listed for channels 1-7 are
IDENTICAL to channels 1-7 on FRS. This is wrong. The GMRS and FRS do
not share the frequencies he listed. Either there was a typo in the book
with the radio, or RS has screwed up royally by assigning dedicated FRS
frequencies to a GMRS radio.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I'm new to this scanner business, and picked up a Pro-51 after comparing it to a Pro-29. I liked the Pro-29's ability to simply push a button to stop the freq scan, as opposed to the Pro-51's requirement to turn the squelch off to lock it on. But I liked having more memory in the Pro-51 better. But now I'm wondering - just how does this thing stack up with other scanners currently available in the same price range ($200-$300)? Should I take it back and get a Pro-26 mail order for "just a little bit more"? And how do those UK Pro-26 models work in the US - does having a different default frequency step cause a problem in practice?

thanks in advance,
-rick

>that expensive. What are the needed parts called.

Tandy stopped supporting the PRO-2004 with repair parts a couple of years
ago. Unfortunately, the display illumination for the 2004 is produced by an
electroluminescent panel (EL panel) of a very precise dimension. That EL
panel is not available, and similar ones from other scanners are too small.

Your ONLY option at one time was really to just replace the EL Panel with a
new one from Tandy National parts (800) 442-2425. Now you are basically
S.O.L. with no good options unless you can find a basket case 2004 that
someone is willing to sell cheap and salvage the EL panel from it.

You could call Tandy and see if you can rag them hard enough to restock
their supply of the larger EL panels. I doubt they will take to a ragging,
though, but if enough people do it.....??????

You could make do with a replacement EL panel from the PRO-2006 which is
still available, albeit too small, and will look bad......bad looks won't
```

hurt anything, though.

Or.....you can get creative and redesign the backlight altogether for something that is available and functional. An idea I have been mulling over is to get a frosted glass slide (like a microscope slide) of the same size as the EL Panel.....and behind it, mount a row of incandescent "grain of wheat" bulbs, or even a bank of green LEDs like what lights up the newer PRO-2035 and PRO-2042 now.

Or perhaps you can be even more inventive and conjure up something no one else has ever thought of.

Good luck.

From sdonnell@ultranet.nh.comSun Dec 1 18:02:53 1996

The V-Link phones as they are called are a very interesting form of
"kiddie talkie". I suspect these could be intended to compete directly

with UHF FRS radios. We got one the other day and played with it quite
a
bit. Yes, 916.875 MHz is their calling/standby freq. They also have 15

other channels on freqs all the way down to 903.48 Mhz that they use
on
an as needed basis for "private" links and depending on other
users/interference on the other CHs. They use good ol analog Wide FM
(25
KHz deviation) for voice transmission. CTCSS/DCS is not used for
selective(private) calling. Instead, they have a high speed digital
ANI
code burst that is sent at the beginning of an initaial transmission
and anytime the CH remanins inactive for 10 seconds or so. The ANI

data burst is apparently how the units instruct others as to what freq

to switch to for private conversations.Hardly all too private
though...One cute feature they have is digital voice storage, to save
messages when the user is not available. I wonder if these might
become
popualr with certain drug gangs...

The transmit power level from the V-Link is only about .2 milliwatts,
so
I can't say they the reported "3 blocks" range is not streching it a
bit
far. Being a licensed Amateur, I have the option of removing the
hardwired antenna and replacing it with an SMA receptical to permit
attaching it to better antennas and or amplifiers

From my personal experience I can say the last sentence about good
managers and good help not staying long has made me think that RS has
a company policy which states that in each store there Must be some
one who knows what they are doing.

The official order:
FIND THEM! KILL THEM!
Then RS will be back to its predictable norm.

The techs of my acquaintance buy from RS if they can walk in and find it and get it and go.

Else not.

A scanner is NOT an alternative to a good radar/laser detector. I use a BCT7 AND an Escort detector. The BCT7 works for me in two ways. On the Ohio Turnpike only I've found the Highway Patrol warning useful, but when the truckers are around, and while driving other freeways, I monitor CB19 for good advance warnings. The radar detector tells me if they're actually clocking, and a radar detector is needed when travelling secondary roads. Hope this helps.

: I thought the GMRS Split frequencies were allocated to FRS only?

Nope. These "split" frequencies, as you put it, have always been the
GMRS "interstitial" frequencies. They are now shared with FRS.

>one and caused more rooftop terror than I care to remember)

Gee you know what the real kicker is? I use a Radio Shack discone on a
five foot mast mounted to the side of my computer desk and it works
fine for me. I can listen to base units in about a 75 mile radius and
locally hear everything I want to hear. The point is that different
things work for different situations. My scanner is the Pro 2042.

Just my 2.75 cents worth...inflation you know...

It may possibly be the power/charger jack. Poke around inside the
jack with a toothpick and gently move things around. The jack
contains a set of contacts that close when the plug is removed. These
sometimes become dirty or loose.

>>the best value.

The "best value" for ME just might not be the "best value" for you!

YOU need to do a little homework! WHAT in your region do YOU want to
listen to? And on what band(s) do they operate?

This homework assignment might be as painless as a trip to your local
Radio Shack store and asking them. Or obtaining a copy of Police Call
for your area.

I mean, what if we all told you that the Unicat Model XYZ was the best -
but it didn't receive what YOU wanted it to?

If there isn't a Radio Shack close by to you, let me know. I'll re-post
an excellent article by Bob Parnass on "finding" scanner freqs!

I'm using a radio shack discone(about $60) with no top piece(I have no
use for low freqs e.g. cb)Two 10' interlocking 1 1/4" metal poles
attached to my chimney with two steel straps(also radio shack)no guy
wires needed.I'm on Long Island and I reach Manhattan (50+miles) and I
pick up individual RMP's(low power 470MHz + up).Will I get better
reception(and/or further reception)by just switching my antenna and
can you justify the extra cost?

Ye publique notice! Harken! Behold! Hear ye, hear ye!

```
+=========================================================+
| Now available: APFTools version 4.00 by Reid Drummond |
+=========================================================+
```

APFTools is a frequency data extractor for text files, (random, chaotic, or organized) that contain listings of frequencies. Such text files could be e-mail, newsgroup posts, forum messages and posts, and even BBS/Internet files where people compose and upload lists of their favorite frequencies.

Text lists are fine so long as you're the pencil & paper type of data user, but what if you use spreadsheets or database managers to store and track vast holdings of frequencies? If you work in the modern ages, then you'll know it's not a lot of fun to manually extract frequency lists for your databases.

APFTools makes quick work of extracting frequency information from text files, even if there is no sense and order to the lists. APFTools pulls frequencies and related ID information out of the mumbo-jumbo text file and creates any of several types of compatible output files, ready for import by spreadsheet or database manager programs.

APFTools also creates AutoProgrammer (*.APF) files for the CE-232 Scanner/Computer Interface in the twinkling of an eye. Gone are the days of manual labor in editing text files to the comma-delimited ASCII format needed by the CE-232. Just feed APFTools a list of frequencies in any order, and out comes the *.APF file ready to go into the CE-232.

Even if you don't have a CE-232, APFTools could be down your alley since it creates output files that are recognized by most spreadsheets and database manager programs.

APFTools is shareware (try before you buy), the cost of which is a paltry $5 to Mr. Drummond, the author, if you keep using the program after the trial period.

The APFTools file details are:

APF40.EXE 290655 01/05/1997 07:57

The previous version of APFTools is:

APF301 .ZIP 256532 11/13/1996 07:53

APFTools is available as follows from the following sources :

==========

Compuserve HamNet Scanner File Library: GO HAMNET

FTP sites: ftp://ftp.cts.com/pub/bcheek
ftp://ftp.cts.com/users/crash/b/bcheek

Hertzian Intercept BBS: (619) 578-9247 after 5:30pm and
(in the FREE file area) before 1:30pm, PST. (BBS closed on
weekday afternoons)

APFTools can be freely distributed in its original archive, and
so may be available at other sites as well as those listed above.

If you can't obtain APFTools by any other means, I can mail it
to you on 5.25" disk for $8, $5 of which goes to Mr. Reid Drummond
as pre-registration for the program, and $3 to cover the cost of the
disk, mailer, postage, and handling. It is strongly suggested that
you should exhaust all other possibilities before ordering the disk,
which is offered as a public service - not as a profit enterprise.

If moving the jack don't help you may want to take the battery pack
apart and check the three solder connections between the jack and the
printed circuit board. I had to repair two packs where the jack had
become loose at the solder connection. The printed circuit board can
be a bit tricky to get out. If you want detailed instructions E-Mail
me.

Yup, that's why radio is so interesting. All the rules seem breakable. They're not, but there are a lot of variables that can't be explained in a short message session.

In your case, though, I think you'll find most transmitters in the City to be atop tall buildings. This alone will give line of sight out to great distances. Like 500-ft, fer instance: The square root of twice 500 comes to 33 miles. Add another 50-ft to the receiving antenna (you) and the distance goes to 43 miles. Then there is the diffraction variable where radio signals are more flexible than light waves, and actually curve beyond the line of sight by another 15% of the distance or so.....that puts your range right at the 50-mi mark. That's conservative, though, since a 500-ft building in the City is a very small one. Most repeaters and transmitters are probably up at the 750-ft to 1000-ft level....for minimum ranges of 40-miles and up.

Also transmissions over water go better than over land. The gentleman down there in Florida probably has the worst of your two situations, though.

>If you're reading this Bill, I got all 3 scanner mod books and

Hi Patrick,

Thanks for the info!

I wonder if it's legal for a GMRS user to talk to an FRS user?

By the way, I just picked up a set of Midland FRS radios, model
75-510 for $149 each. The units have all 14 FRS channels with
a built in Scan function and all 38 CTCSS tones! The unit came
with 4 AA Nicads and 6 Volt Charger/Adapter. It's a real steal
for only $149, considering the Motorola Sport 7 lists for $119
and the Sport 7x for $139 at EEB. I also noticed the Radio
Shack is selling the Sport 7x under the Radio Shack name Model
FRS-105 and they want $179!

The Midland Model 75-510 sells at EEB for $149, their Home Page
can be found at the following URL:

http://www.access.digex.net/~eeb/eeb.html

More info on FRS can be found at the following URL:

http://home.navisoft.com/nspi/frs.html

The 14 Channels are as follows:

Channel 1 462.5625 Mhz
Channel 2 462.5875 Mhz
Channel 3 462.6125 Mhz
Channel 4 462.6375 Mhz
Channel 5 462.6625 Mhz
Channel 6 462.6875 Mhz
Channel 7 462.7125 Mhz
Channel 8 467.5625 Mhz
Channel 9 467.5875 Mhz
Channel 10 467.6125 Mhz
Channel 11 467.6375 Mhz
Channel 12 467.6625 Mhz
Channel 13 467.6875 Mhz
Channel 14 467.7125 Mhz

The 38 CTCSS tones are as follows:

Tone 01 67.0 Hz Tone 20 131.8 Hz
Tone 02 71.9 Hz Tone 21 136.5 Hz
Tone 03 74.4 Hz Tone 22 141.3 Hz
Tone 04 77.0 Hz Tone 23 146.2 Hz
Tone 05 79.7 Hz Tone 24 151.4 Hz
Tone 06 82.5 Hz Tone 25 156.7 Hz
Tone 07 85.4 Hz Tone 26 162.2 Hz
Tone 08 88.5 Hz Tone 27 167.9 Hz
Tone 09 91.5 Hz Tone 28 173.8 Hz
Tone 10 94.8 Hz Tone 29 179.9 Hz
Tone 11 97.4 Hz Tone 30 186.2 Hz
Tone 12 100.0 Hz Tone 31 192.8 Hz
Tone 13 103.5 Hz Tone 32 203.5 Hz
Tone 14 107.2 Hz Tone 33 210.7 Hz
Tone 15 110.9 Hz Tone 34 218.1 Hz
Tone 16 114.8 Hz Tone 35 225.7 Hz
Tone 17 118.8 Hz Tone 36 233.6 Hz
Tone 18 123.0 Hz Tone 37 241.8 Hz
Tone 19 127.3 Hz Tone 38 250.3 Hz

Does anyone know if Maxon has an FRS radio out yet?

Thanks,
Bob

Do you know if Maxon has an FRS radio with some of these features yet?

Midland just came out with a 14 Channel FRS radio that includes a Scan function and has all 38 CTCSS Tones! The model number is 75-510 and it sells for $149 at EEB.

>listening, it sounds like it's coming from San Francisco (they reference
>street names from SF anyway) and it seems like it might be a law
>enforcement agency, but which one? Isn't this in the federal band?

According to my 1995 "Police Call", they use 154.800, 155.070,
155.655, 155.670, 458.750 for police and they have 814.2375 and
859.2375 listed as local government freqs. They may have gone to a
trunked system. You could try a local Radio Shack store, they usually
have a list of local freqs. that they will *sometimes* share. Maybe
Bill Conduit will see your post and reply but he's probably busy
covering the floods out here.

417.575 is (or was) used by Geological Survey. It's a Federal
Government frequency and the book gives it a "U" code which means
unofficial. It's hard to say which agency might be using it.

I am using a discone too and I can listen to cops in Bristol Tennessee
on VHF.
I live in Sevierville Tennessee, over 60 miles away.
Knoxville police is on 800 mhz and I hear them good...they are 25 miles
away.

Oh yea, My discone is 14 feet off the ground and I *don't* live on a hill.
With any decent outside antenna you ought to be able to hear signals up to 40 square miles EASY.

This is not a opinion....just the facts!

After trying some shareware programs, I found each one had it's
strengths & weaknesses. I went to just putting everything in an Excel
workbook. Start with one big ol' list from 25 to 1300+ MHZ and then
resort by name, catagory, frequency, or backup lists of every scanner
in the house. MS Excel formats are also easy to share.

Sometimes it's desired to have a frequency duplicated. I have one 40
channel bank of the 'Top 40' frequencies to hear my favorites, then
some of those may show up again in a locked out bank that only has
search & rescue. When there's an exciting ocean rescue underway, I
don't want to hear the public works department or the power company-and
do want to hear the local PD & Fire, without needing to lock out
individual channels.

Hi Lorin,

you should check out the August issue of Monitoring Times, it has
an article on Fast Food Monitoring which can be viewed online at
the following URL:

http://www.grove.net/fastfreq.txt

You can also view several Fast Food Frequency lists at the
following URLs:

Chris Evans (woody@eudaemon.com) wrote:

: So I got myself an Opto Scout with the DB32 miniantenna and I must say I'm
: not impressed with its performance.

To be honest with you, people who say that generally don't understand how the Scout works and perhaps have unrealistic expectations of it.

The Scout (in filter mode) will alert on any RF signal that is 10-15db stronger than the background RF noise and stronger than anything else it can hear.

This hints at a VERY important point - the strength of the signals it will find (and therefore the range from which it will find them) depends heavily on how noisy your environment is and what other transmissions are around. These factors may not be obvious to you, which is why the Scouts performance differs from your expectations.

Also remember that the Scout is a wideband device, and it is sweeping from 10MHz to over 1GHz. THE MORE YOU CAN NARROW DOWN YOUR BAND OF INTEREST USING TUNED ANTENNAS AND BANDPASS FILTERS THE BETTER THE SCOUT WILL WORK.

For example, I have a 400MHz whip antenna I use on the Scout for capturing 400MHz land mobile. Using that, the Scout will lock onto the transmitters on top of our (14 floor) Police Station from 1-2 blocks away. Using the DB32 wideband antenna, it often doesn't lock on when I'm standing outside the front door of the station.

The 400MHz whip is sensitive in the area of interest, and deaf everywhere else. This has two beneficial effects. Firstly, the gain is higher in the area I'm interested in so the Scout will be more sensitive. Secondly, the Scout is deaf to RF noise and other signals elsewhere in its coverage - less backrgound noise and distraction = better performance.

The DB32 is good for general close-range (<20-30m) capturing when you don't know what frequency or band you'll be getting. Tuned antennas are better if you have a specific target, or know what band will be used for the transmission you are looking for.

: It doesn't even pick up my housemate's cordless phone unless it's in the
: same room.

What did you expect? Some magic device that hones in on extremely weak signals from blocks away? Cordless phones are VERY weak and don't stand out above the general RF noise and other signals (eg. FM or TV transmitters) unless you are really close to them.

: What can I do to increase its range?

1. Obtain a selection of whips for the frequencies you are interested in capturing. The DB32 is good if you need a small antenna or for wideband use, otherwise its useless. I'd suggest 800MHz and 400MHz whips, plus a good telescopic.

2. Use it in an area that is less noisy - computer RF noise for example can have an effect.

3. Use it with a beam - great for DF!

4. Buy the (very expensive!) bandpass filter for it, which is meant to increase the Scout's range by about 10 times.

Do you know anyone with a handheld transceiver (UHF commercial? UHF CB? Amateur?)? If you do, try an experiment. With a 5 watt RF output the Scout should hit on the handheld from 15-25m away using the DB32. Replace the DB32 with a telescoping antenna, and extend it a fair way so that it is more sensitive to lower-frequency signals (eg. VHF). The range from which the Scout will find the transceiver will decrease. Adjust the whip to be 1/4 wave for the transceiver frequency and the detection range will increase.

I've done this to demonstrate to people that the antenna makes a HUGE difference to the operation of the scout.

Perhaps the documentation that comes with the Scout could be improved to assist people who don't really know how these things work. I've seen posts from plenty of people who didn't really understand what they'd bought and how to get the best from it. Its not as simple as "switch it on and lock onto police transmissions 5 blocks away".

Woody....dont "dump it" that antenna is good for most frequencies in the
400 to 1000 MHZ range (best in the 800mhz). Keep it when you want to
catch those frequencies.....but do like Mike said, get other
antennas....try a several....test them out with different transmitters.
You will find that there is a right antenna for the right job.

The Scanmaster books give detailed information on the systems covered--far more than just a frequency listing. The information is compiled by local researchers and is generally more accurate and detailed than FCC data. Maps of departmental patrol districts are included for some areas as well as "10" codes, etc. The system information is usually obtained with the help of the agencies listed, so it is usually very accurate. I have the Illinois book and I believe that it is well worth the money.

Was driving through the desolate regions of Arizona yesterday, and in between listening to the DPS having a high speed pursuit, I was listening to some millair freqs I dialed in, and on 274.000 I kept hearing something with the callsign "Darkstar" talking with a tower or control "Yuma." This channel was supposedly a Yuma Proving Ground channel, so I'm figuring it was Army related. The comms went something like this:

"Yuma, Darkstar, if they're not going to meet thier push time, can we go ahead and extend the range time for our operations?"

"Roger, we'd like to extend the range restriction time about 20 minutes to 18:20, and we can get a little more of our work in here."

"Darkstar copies, we'll give you a call when we're done."

Anyone know what this might have been?

Yeah, I enjoy listening to it too, especially when the employees in the kitchen get into the picture. Anyway, I have only heard one of these establishments where I could hear both ends of the signal, and it was a Hardee's. Don't know where, but it was on a vacation when I found it.

In addition to 154.6, 154.57 is also a good frequency for fast food. I believe that KFC and Wendy's use this freq, but I may be mistaken.

Happy Scanning,

Chris,
You might want to try an extenable whip antenna and use of a
low/band/high-pass filter to concentrate on a desired region of
the RF spectrum. You might also want to look into whip/duck
antennas tuned for particular regions(usually for ham gear)
from suppliers like AES.

Strong signals,

Dump it. The DB32 is a UHF antenna that is sold simply because it is
small. Its performance overall, but especially out of band, is abysmally
bad. Try some duckies from your scanner.

I'm not certain by your description, but the most common "scrambling"
method for cordless phones is what's called "speach inversion". The
devices inverts the high and low frequencies, giving a Mickey Mouse or
Alien kind of effect. If this is what you're hearing, there are
inversion kits readily available from a number of suppliers. I
believe one of the most popular is Ramsey Electronics.

Hello Everybody!

Just thought I'd let you know that I have been, and continue, compiling police and fire frequencies for the Rhode Island and Massachusetts areas. Please visit me, and send me any if you have them. I will be sure to add them to my website!

Note: This listing contains only listings for Rhode Island and Massachusetts.

Thank you!

Nate Powell

True enough.....to some extent. Like for 800-900 MHz signals, that is eminently true. But for VHF and lower UHF signals, this "bounce" becomes absorption for a total or near total loss. "Bounce" entirely depends on the frequency of the signals and it is limited pretty much to the upper end of the UHF comms segment.

> I have a guestion for Bill Cheek and anyone else who would care to reply:
>

There are two: the Icom AH-7000 and the Diamond D-130J. These are good ones, well made, and have the low band extender.

The Radio Shack discone and so-called discones from Antenna Specialists are not of very good quality and do not have the extended coverage of the first two above.

Source record: 212731

While watching "COPS" last Sunday, i noted the Miami PD using "Q" signals, much like amateur radio operators, (QTH, QSL). Is this the case? I have never heard of this in public safety communications, and I have been actively monitoring since 1964.

Interestingly enough, it is thought to be poor operating practice to use "Q" signals in voice communications in the Amateur community. They are mainly utilized for CW operations.

Any feedback??

608. RS's 1000 channel pro-2042 model a joke

Newsgroup: rec.radio.scanner
Date: 1997-01-07 00:00:00 UTC
From: myway@ix.netcom.com
Message-ID: <5au1iv$4jq@sjx-ixn8.ix.netcom.com>
Source record: 212734

This new scanner by RS with oooohhhh 1000 channels....2042
wow. no wow. no nuttin'/

My BC 210xlt is more sensitive than this new high-tech
sham of a radio....does more things but cannot pick up
signals.....

I programmed in the 460's and the 488's I normally listen to
in the first bank and turned my BC 210xlt on to the "ON"
position....and listened.

the RS 1000 channel unit missed the 460's and the 488's
80 percent of the time as the BC just kept them coming
as I made notes....

the RS model is good for the 155's and the 46's. and the
42's....much like the results of my old bc 890 xlt...which
is an impotent piece of limp-burger.

The speaker is terrible compared to the bc 210xlt.
the sound is terrible compared to the 210 xlt.

what we have here is programming 1000 channels and not being
able to hear anything much.....

Ain't progress wunnerful?

I am taking this unit back to RS today and see about a new
mobile unit they have with 100 channels....if it's anything
as good as the RS Patrolman scanner in my car, then it will
suffice....if not, well, RS scanners are suspect. At least
the table models....

bill conduit
etc.

i don't have the

I don't think you read this right.... The transmitters I mentioned
are MOBILE (ie - police cruisers) as stated above.

I don't think they require the cops in these areas to drive up to
pike's peak before pressing the little button!!

All your other points, or lack of, basically state "there's too much
to consider - sometimes it works, sometimes it don't". This is ok, if
there are no hard-fast rules on these distances and what to expect, I
can live with that answer. It just would have been nice to get it
without all the fancy attempts at making it vague.

All scanners can be modified......for something. There is nothing written up for 95% of all scanners ever made, though. You either adapt some mod written for another scanner or invent one.

"Copies of mods" just don't exist except for the more popular scanners, and even then, there is only so much technology that can be conveyed in an ASCII text file. Most mods are written up in magazines and books where the accompanying photos, tables, charts, and graphics can tell more of the story to support the words.

Had my first fast food scanning "experience" today. I had a "Big Mac attack" so I hopped in the car with my scanner, which had some of the common McDonalds freqs programmed into it. The line at the drive-thru was short, so I didn't have time to really search. I could hear one side of the conversation ("May I take your order?") on 154.6. I couldn't find any other freqs. Also, this McDonalds had a VERY low power transmitter. I had to be in the parking lot before I could hear a thing. Maybe I should sit in the parking lot and search for freqs... :)

Just thought I'd share that with you all. :)

RS publishes a sale flyer each month, and as far as I am able
to remember, they have at least one scanner on 'sale' each month.
RS has a very high profit margin on its inventory.
Seventy per cent profit is normal for RS, so they can cut thep
price of most anything in the store in half and make about
as much profit as any other retail electronics store.

And I have been offered special deals by the store manager
at times, on closeout and demo items. It pays to get to
know the manager.

-major snippage-

after reading all of those replies, I still think I have a useful bit.

There are a bunch of 417.XXX freq.s that are used by the Federal
Protective Services Police, (if you live in S.F. they are the cars with
two blue stripes and art-deco letters) The Primary is 417.200 with a
couple of tacticals. Most of you probably already knew that but here's
the interesting part...

Lately, we've been noticing that they have been simulcasting some of the
local city channels onto frequencies in the 417's. If you were around
for the UN 50th anniversary, there was a lot of weird simulcasting and
crossbanding going on in the low uhf and vhf around 140. I'm quessing
that the drug bust someone heard was actually rebroadcast from
PIC-9/PIC-10 on 460.025, there are a lot of city task forces working on
that channel and they're all in the clear.

Can anyone tell me what the best scanner is?

I am looking for a Scanner that has all channels to scan and can pick up anything... Thanks.. Please reply to my email address because I hardly get on Newsgroups.. Thank you :-)...

-Mike

They sell for $79 at Toys R US and EBX stores and $69 at Wal-Mart.

However, I would not recomend buying them! They only have a range of about $1000 feet at best and have problems establishing a Private Link if a party does not issue a response within 10 seconds! I found that the units would often get out of sync and required all parties to turn the units Off and back On again to re-establish a private connections! The units had no problems establishing a connections when they were used in Public Mode.

I recomend that you save your money and buy one of the Midland FRS radio from EEB. They list of $149 and have all 14 FRS channels, a built in Scan function and all 38 CTCSS PL tones.

From: Ken Klimasewski <n1kk@idt.net>
Message-ID: <32D2E977.287C@idt.net>
Source record: 212756

I am having a problem with my AEA ACARS software. After about 5-10
minutes it causes the pc to hang. I have to re-boot the pc. Also
I can't get the "file log" to work. Mybe my program is bad. Can anyone
pass along any info or maybe a copy of AEA ACARS incase mine is NG.
I am using it with the AEA FAX III demodulator.

thanks,
Ken

631. New version semasoft 1.15, pocsag decoder

Newsgroup: rec.radio.scanner
Date: 1997-01-07 00:00:00 UTC
From: Rene Hagen <hagenr@involve.nl>
Message-ID: <01bbfc94$10eac000$a7a4fecd@thinkpad.nl.net>
Source record: 212757
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have uploaded the new semasoft 1.15. This version works with even more scanners and can be registrated. So you can finally get rit of the 10 minute limit.
So download it now and have fun.

The best way to find wich site to download it from is to go to www.shareware.com and search for 'semasoft'. This will list all sites where it can be downloaded. You can download it also directly from the simtel site.

Below you find the upload announcement:

I have uploaded to Simtel.Net:

http://www.simtel.net/pub/simtelnet/win95/ham/sema115.zip
ftp://ftp.simtel.net/pub/simtelnet/win95/ham/sema115.zip 901843 bytes

sema115.zip Semasoft v1.15: Decodes pocsag messages

This program will decode pocsag audiosignals from a scanner connected to your soundcard. Pocsag is a standard for pager messages. This is version 1.15. This version can be registered.

Special requirements: None.

Changes: Improved bitdecoder, setup program, registration wizard.

sema115.zip has replaced sema114.zip.

Freeware. Uploaded by the author.

I have a page describing the constuction of a duplexer
at:

http://www.dallas.net/~jvpoll/dup6m/dup.html

It is for the 52 MHz area ... but similar constuction
techniques scaled WAY down (size-wise) would yield
good results at UHF. In fact, the idea for this technique
came to me years ago while 'de-structing' a Motorola
UHF duplexer from a MARK 12 IMTS UHF Mobile Phone.

Other components needed for a repeater such as 1) controller,
full-duplex capable 2) Receiver and 3) Transmitter,
4) antenna (that won't cause desense) and, most importantly,
5) a site may be desribed adequately on other web sites.

Source record: 212764

A few years back I ordered a BC 100XLT battery directly from Uniden. Radio Shack also had it available through their special order service.

I bought the new battery because the old one seemed unwilling to hold a charge. After getting the new one, I took the old one apart and found that it consisted of either 4 or 6 (I don't remember now) AA cells soldered together in series. At the time, RS had just introduced some high capacity AA NiCd batteries, I bought the required number and wired them together replacing the old dead cells. I had to mill out the inside of the battery's outer box since these cells had the little tits on the + end, they were a tad longer than the old cells. Once all was said and done, I had a functional battery that now gives me a consistent 8 hours of service vs 5 hours for the old battery.

639. WTD: AOR manual/schematic

Newsgroup: rec.radio.scanner
Date: 1997-01-07 00:00:00 UTC
From: Michael Kassay <mkassay@sympatico.ca>
Message-ID: <32D27090.48AD@sympatico.ca>
Source record: 212765

Hi.. I have what appears to be a RARE AOR product...
Its a AOR AR-22 synthesized pocket receiver,,
it covers 140 - 149.995 mhz - monitors one frequency at a time, it does not scan...
What Im looking for is a manual, and most of all a schematic for the unit.. There is
a picture of the unit in January 1983 QST magazine.
I called ACE communitcations, and other scanner companies...They have never heard of the
AR-22.....(and it was ACE who advertised it)

Does anyone else own one of these units??

Can anyone help me with obtaining a schematic??

thks...

Tuesday, December 3, 1996

LMPS -- The City of Baltimore officials broke ground for the city's new 800 MHz digital trunked two-way radio communications system. The consolidated $38 million system, including a communications center, will replace a number of different radio systems operated by individual agencies that no longer met the city's increasing communications needs.

The new system's 10 sites, 28 channels, and wide-area, or simulcast configuration is designed to permit personnel to communicate reliably with each other throughout the entire coverage area whether they are on foot, in a vehicle or in buildings and tunnels. /Motorola Press Release/

They vary from store to store. Here's a tip to get you started:

At least in Illinois, Sears usually licenses it frequencies
under the name "Fleet Maintenence."

You should invest in the Virginia/Metro D.C. Guide published by Scanner MAster
Publications, P.O. Box #428, Newton Highlands, Mass. 02161. Phone: (800) 722-6701. A few suggestions in the meanwhile: Co. Sheriff-39.24, SIRS (Mutual
Aid) 39.54, 39.20 (Tactical). I think you will find this book complete at least as
far as the emergency services, for other business and industrial users try Percon
Corp. or Grove Enterprises.

Ain't that the truth! A while back that guy made a post selling
linears and the only ones that said anything were those wanting to buy
one. Poor old Bill makes an informational post and all the usual
"suspects" accuse him of everything from misusing the newsgroup to
fraud! There just ain't no justice.

For those of you with questions about listening to cell calls please check out this page for some answers. I'm only doing this to answer the questions that are asked 10 to 20 times a week on the scanner newsgroups.
If you find a error...give me a yell....or if you have another (FAQ) frequently asked question you want me to ad to the list, let me know. I hope you have the answer for it too!

>hill. With any decent outside antenna you ought to be able to hear signals up
>to 40 square miles EASY.
>
>This is not a opinion....just the facts!

Up to your last sentence may have been "facts", but the last sentence is just an opinion, and not particularly accurate. There are many variables to good VHF/UHF reception, including in your case, the terrain. Hilly or mountainous county like around Sevierville is especially conducive to good communications if the transmitter/repeater sites are located on the mountaintops.......as most are.

You would NOT receive signals transmitted from another discone at 14-ft over in Knoxville or Bristol.....that's for sure. In your case, the credit for your good reception lies with the services you monitor......not with a discone at 14-ft. The services you mentioned are designed to reach mobiles and handhelds at extreme distances over the service areas. A discone at 14-ft is a bit superior to mobile and handheld antennas.

By and large.....and take this to the bank......VHF-UHF signals are MEANT to cover given areas to minimal mobile equipment. Therefore, even your last sentence is accurate to that extent. But once your interest moves away from the cops and robbers and into monitoring signals that are designed for point-to-point....then your statement falls apart. When you want to hear everything there is to hear, your statement isn't accurate.

It takes a little more than a "decent outside antenna" to hear all there is to hear. A lot depends on what you hear being designed for wide area coverage.....as are most cop shops, pizza delivery services, and land-mobile services. If it ain't designed for wide area coverage, then a 14-ft discone either won't hear it.....or will be "lucky" to be within proximity or the transmission path.

The variables just go on and on and on.....lots of if's, and's, or's, and but's.....

no@e-mail.com (Mike) wrote:

>Seems to me there should be some mention of output power of the
>transmitter?

Nope. Power is one of the least significant variables in VHF-UHF propagation. It does matter, obviously, but not like you would think. There is a point of diminishing returns with respect to RF power over distance....due to a number of variables. Basically, if you double the power, you might be lucky to get 25% greater distance.

> This must be a significant factor.

Not nearly as significant as height above average terrain; gain of the antenna, and minimizing system losses.

> I am using a RS discone (without the lowband whip) and can get
> 39Mhz mobiles about 35-40 miles away and I am well under the
> values in your example.

That's because the transmitters you mentioned are designed for wide area coverage, most likely located atop mountains, hills, or tall buildings, or even towers. Their design is 80% of your success.

>On upper UHF repeaters, I am doing much better on distance.

Well? You think repeaters are designed and located in "holes"? Of course not. The suckers are on mountains, hills, towers, and buildings. The equations for VHF-UHF path propagation include heights above average terrain for BOTH the transmitter AND the receiver. If the Tx is at 500-ft, the Rx can easily be at 10-ft without adverse impact. But this is the nature of VHF-UHF communications..... coverage is by design, you see.

>Seems there should be more on this formula.....

There is. Line of sight is only the first consideration in analyzing a radio path, but it is the MOST important of the many considerations. If you don't have radio line of sight, you ain't gonna hear the sucker without enhanced design, luck, or environmental conditions being in your favor. In your case, you are capitalizing on the designs of the transmitters and repeaters to which you listen.

In most cases, that's about all a scannist can do anyway. That's why telescoping whips and rubber duckies work.

It isn't magic. It's physics. And there are few, if any "pat" answers, but neither is the sum of the answers all that incomprehensible. Like anything

else, it takes a little study and experience.

An even better idea might be to look into the Ramsey FM-10 kit. This unit
give your stereo sound that you can listen to with any FM broadcast
receiver. (boom box for better sound?) A friend of mine built one and
feeds his scanner into the left audio channel and the BBC from his
satellite dish into the right, puts on his stereo headphone radio on while
he works in the yard. I'm not sure who all sells them but I know I have
seen them in the JDR Microdevices catalog. Hope this helps.

Sounds like some kind of a stake out or observation post. Could even
be a mobile one in a van or something. Local law enforcement agencies
probably *borrow* federal freqs. for covert units and operations.
They might even have the FCC's blessing to do so. They don't have to
play by the same rules that you and I do :)

Simple answer to this question is a question... Are you using the
antenna(s) that
came with the AR2700? If the answer is yes get a different antenna.. For
example
the Radio Shack 30-1300 Telescopic for about $10.00 (US). The antennas
included
with the AR 2700 are crap.

OK, here's the deal. I have an IBM ThinkPad 720 mono that is collecting dust.

The package I have includes: laptop (486/50, 12/240, all ext. ports, 1.44 floppy, 2 PCMCIA slots), AC adaptor/charger, 3 extra batteries, 2 extra 160mb hard drives, 2 docking stations (both with full set of ports, SCSI-2, 2 expansion slots, 5 1/4" drive bay. One has 2x IBM SCSI CD-ROM.), external battery charger, and hardshell carry case with handles and wheels. Everything

is in excellent condition. Current value on today's used market is about $1200 for everything. Would prefer to keep package together, buyer pays shipping.

What I would be willing to trade for: cash, BC 9000xlt, 2m/70cm handheld, AOR

AR8000, PRO26, PRO2006, BC 3000XLT, Icom R7000, digital general coverage receiver, and
possibly other items. Will accept combination of above or other arrangement to equal value of laptop and accessories.

Please email offers and questions. Thanks.

If you were trying to decode a specific phone, you would need a great deal of time and computer power, but if you are "scanning" a range, you can "hit" phones. It is being done now!

667. Modifying a discone antenna to pick up low freq.

Newsgroup: rec.radio.scanner
Date: 1997-01-07 00:00:00 UTC
From: dragon@netshop.net
Message-ID: <5at71p$jk3$1@noc.van.hookup.net>
Source record: 212816

I am in the process of building a discone antenna to pickup 500mhz and up. Now should I build a extended antenna to the top of the disk (solder it to the center of the disk and have it 4 -5 feet tall above the disk) or have a seperate antenna and connect the two with a splitter to my scanner?
what are the pros? cons? Ideally, I would like to have as few antennas as possible(this is probably a common belief held by everyone :))

Any suggestions would be appreciated.
thanks.

It has now obviously been done with the new Uniden Trunking compatible scanner r
receivers, which will hopefully make there way down here in Australia really
soon....

But does anyone have any information relating to the actual protocol used
on the Motorola Smartzone trunking system ?

Cheers
Michael

I've seen the same thing too. I compared my AR2700 to my RS Pro46. As far as reception goes, the Pro46 won hands down. But the AR2700 does win on 'features' though.....

A UAV is pretty unlikely to be chatting on the radio, for obvious
reasons!! No doubt this particularly "Darkstar" was something else.

/Leif

Sounds an awful lot like Darkstar was planning on controlling some air/ground ordnance runs. A FAC perhaps? The folks he was supposed to control were late and he wanted to extend the range time to get the mission done. (My best guess only.)

Last night on the Discovery channel, there was a program on UFO's. They have been running a series this week. They had a scanner enthusiest on who had a tape of a "darkstar" transmission. They (the show) were suggesting that "darkstar" is the Aurora project. A very high speed aircraft (mach 8) that is supposed to be a big governemnt secret (much on the scale that the stealth bomber was a few years ago). Don't know how much truth there is to the matter, but it was the same call sign (I think).

....
the ability to acheive low profile doesn't strike me as an issue of shape...
for the most part, it seems like antennas fall into general categories of shape...
...and then have only minor variations of shape to suit...
in which case...copying shape shouldn't pose a problem...?...

for these 'gov.' antennas...
would their ability to acheive low profile be due to material composition???
...the, apparantly, only other major factor for such...
in which case...is there a correlation between density and reception...
i.e.: reception improves proportionally to an increase of antenna density?

would an antenna necessarily need to be of metal???
...ceramics? composites? glass? plastics?...

While watching "COPS" last Sunday, i noted the Miami PD using "Q"
signals, much like amateur radio operators, (QTH, QSL).

I too noticed this -- and YES, they are using the Q-codes -- the same as
amateur radio uses. I got my Florida scanner book out and looked up Miami,
and sure enough, there they were listed !!!

679. Larson Kulrod NMO-34. What is it for?

Or.... get one of the new Motorola units - they have the upper seven frequencies and six PL frequencies (as well as the option not to use PL).
Very nice design - three AA bat. Should be plenty at about $100, or less. Enjoy Mac

I agree. It sounds like Darkstar (a unit using the range) was asking
Yuma (range control) that since someother unit was not going to be
finished on time would it be possible for Darkstar to continue their
exercise past range closure (1800) until 1820.

This is somewhat common on Army firing ranges. No one is hot on the
range if range control is not open.

Hi Steven,
A good one to have is a Uniden BC-760xlt, They can be modified for 800Mhz (cell phone) and are small enough to fet in most cars. 5 3/4" wide and 1 1/2" tall. They have 100 ch. They work well in the car and have lots of audo, which is a must in a car. I have one, I use in the shack and take it mobile when I go on a trip. I am a Ham Radio Operator and it picks up the ham-bands grate also... I hope this helps you out, good luck. Buy the way the BC-760xlt sells new for around $200.

Talk to you later,
Boyd N6DMF

Hi Mac,

Which Motorola unit are you referring to?

I've seen the Sport 7 which is a 7 channel radio with an internal
channel selector (flip dip switches). It lists for $119 at EEB

I've seen the Sport 7x which is a 7 channel radio with an external
channel selector. It lists for $139 at EEB

Niether of those have CTCSS and only carry the lower 7 channels
of the FRS band (in the 462 Mhz range).

The Midland 75-510 has all 14 FRS channels, a built in Scan function
to scan all 14 channels (includes a lock-out feature), 38 CTCSS PL
tones. It also comes with 4 "AA" Nicads and Charger/Adapter. It
lists for $149 at EEB.

I know Radio Shack carries the FRS-105 which is the same radio as the
Motorola Sport 7x. It lists for $179 at Radio Shack.

Try a few of these: 160.800, 160.920, 161.070, 161.460. These are road channels, which are used when the towers or control points need to talk to the trains for instructions or warnings, i.e. track switches, trains ahead, speed restrictions, etc.
160.275, 160.295, 160.395, 161.460. These are yard channels. Mostly what you hear on these is yard and shop crews getting instructions for switching cars and which tracks to leave them on.
160.350 is the main SEPTA channel for the regional rail lines within the city limits, which is mostly underground. It is also used to contact the maintenance desk, which handles all necessary functions when a train breaks down. If you commute into Philly, this channel is a must to have on your portable, because if and when a train breaks down, you are able to hear the lowdown on what is really happening long before the conductor gets on the PA system to announce it.

I hope that these are of some help to you.
Good luck and happy scanning.

I have owned the Pro-26 and the AR-8000 along with other RS scanners like the Pro-32/34/37/39/43, and I can tell you the performance of the 8000 is superior to the Pro-26 and all of the others in the areas of intermod, I.F. images, adjacent channel rejection, etc. In scanning and searching speed, the Pro-26 is much faster than the AR-8000, one advantage in it's favor.

I had constant problems with the Pro-26 hearing pagers, NOAA Weather and other I.F. image interference, it swamped the 26 to the point it was useless on some frequencies. It hears cellular phones in the 900 MHz range, right where I want to listen to 900 MHz cordless and other wireless transmissions.

No such problems with the 8000, it hears what it's supposed to and nothing else. The 8000 is the best handheld scanner I have ever used. It's HF performance is not as good as it's VHF/UHF performance, but the Pro-26 doesn't offer coverage below 25 MHz, no SSB, no Alpha numeric display, only 200 channels vs. 1000, no band scope, the list goes on and on.

One would have to decide if the numerous features would be to his or her advantage. To compare the Pro-26 to the AR-8000 is really comparing apples to oranges, they were designed for markedly different tasks.

The alpha numeric display and 1000 channels are worth the extra expense to me simply because I load hundreds of federal and military frequencies into the scanner and then I have to either remember them all, or carry a list. The alpha tags eliminate that problem.

I use radio communication equipment for a living, and that's my opinion for what it's worth.

Happy New Year to all,

Jon Van Allen

Do you think that no one is controlling the UAV in test? They surely would
be on the radio making sure their precious cargo doesn't attempt to share
the same airspace with another type of craft.

Sounds like their "Range Control" to me.

Most Handheld scanners have earphone jacks ie Bearcat, Radio Shack,
AOR, and Uniden, Those are the only brands I have ever owned.
..
What is it that you want to monitor? Also do you live in or near a large
city? If you
live near a large city you will want more Channel capacity. I live in the
Miami - Ft
Lauderdale area and can easily fill up a 200 channel scanner.
Also if you live near a Military Base you will want Military air.
..
All the options above add cost you can generally get a Handheld scanner
from
about $150.00 to $700.00. The $700 is for an AOR8000 1000 Channels with
Computer control ability and all. The $150 is for a Bearcat Sportcat 200
Channel scanner No mil air.
```

Try the following Locations:

Your local Radio Shack store
http://www.scannerworld.com
http://www.aorja.com (Unsure but believe this is the proper homepage
for AOR)

Also you can search for Electronic Equipment Bank in your favorite search
engine
they will have some scanners at a good price.

Well good luck

Thanks for the keypad tricks for the SC-150!! I have no idea what the last few tricks do? If anyone has any idea I would like to know!

Also it might be a good reminder to some to know that when you do the tricks except for the voltage level, the programmed frequencies go "bye bye", well at least mine did.

Thanks Again

Does the BC3000xlt have the same exact freq range as the BC9000xlt?

Does the 3000xlt have a low-high limit search?

Does the 3000xlt have preprogrammed fire, police, marine, air or
weather searches?

Are there up/down buttons to control the direction of a search (like
with the pro-51)?

Kelly

I bought the Nevada brand double discone for a couple of reasons.
I could use it for transmit and scanning, more gain than a regular
discone {regular discones I am told have pretty much zero gain}, wide
band so it could cover many bands and keep the wife from complaining
about another ant. The spec sheet says that the double discone will
only load up for xmit at 80 mhz thru 1300 mhz. That worked for me.
In general I am pleased. Very rugged construction. It just went through
the California wind storms and still looks like a double discone. It
does load up on the ham bands ok. My only complaint is that it might
work a bit to well for my location. When I use it my radios sometimes
suffer from signal overload and intermod problems. I use a triplexer
with the ham radios and am considering buying an in-line attenuator
to reduce signal delivered to the radio front end. My opinion is that
it was a good "max bang for your buck" purchase.

so THAT's how one listens in on trunked systems... :) ...nifty...
while on the subject...
i have a general idea as to what trunked systems are...
...but i would like somewhat of a definitive explaination...
also w/ regards to such...
how does a trunking scanner (e.g. bc-235xlt) follow a trunked system?...
if the aforementioned way of following works...
(load all the channels and just continuously scan)
...why hasn't it been implemented sooner...
(as with what the bc-235xlt is aiming at...?)
...it _seems_ simple enough a concept,,,
(seems, but is it?)
...multiple channel receiving...
thanks. :0)

Most likely it was an AWACS (E-3). Usually the callsign is followed by a
letter as in DARKSTAR MIKE. They routinely play dog-fight games over
Texas with fighters and go to New Mexico to play ADIZ intercept games.
Been lots of training lately using data links to other aircraft.

From: cyrild@worldnet.fr
Message-ID: <32d40bcc.3387334@news.sct.fr>
Source record: 212607

Hi,

I ve got a AM/FM scanner from 50 to 900 MHZ which is a Standard AX700,
with a built in band scope.

How can i receive signals (packet radio, SSTV, etc) and what kind of
software do i need ?

Thanks in advance.

710. Formula for calculating UHF TV broadcasting

Newsgroup: rec.radio.scanner
Date: 1997-01-08 00:00:00 UTC
From: Jurgen De Vlieger <jurgendv@tornado.be>
Message-ID: <32D3A25A.2FFD@tornado.be>
Source record: 212609

Hi,

Just read a technical article in a Dutch magazine about TV broadcasting,
they stated next formula in the article for TV reception :

a = 4 */(h1+h2)

a = range in kilometers
h1 = height transmitting antenna in meters
h2 = height receiving antenna in meters

I guess something is missing after the *

They also gave following examples :
if h1 = 150 m and h2 = 15 m then a = 51 km
if h1 = 50 m and h2 = 5 m then a = 30 km

The formula stated is a simplified one, I'd appreciate if someone could
come up with a solution for this one.

Replies by email only please since I ain't subscribed to this newsgroup

The best mobile scanner antenna that I have ever used is the Antenna
Specialist Mon-51 mag mount. It is good from the low bands thru
900mhz and probably higher. Radio Shack puts out a decent mag mount,
and for vhf-low and up, the MFJ $15 dollar mag mount 2meter/70mm ham
mag mount antenna is great!

I suspect that the data errors originate with the FCC and not Percon. When
we would get the data from the FCC contractor on 9-track open reel tapes,
we had the same problem.

714. Signals below .55 mHz

Newsgroup: rec.radio.scanner
Date: 1997-01-08 00:00:00 UTC
From: bmm1@fn3.freenet.tlh.fl.us
Message-ID: <5b0r8u$ljt@fn3.freenet.tlh.fl.us>
Source record: 212613

I was listening to frequencies below the AM broadcast band the other day. There are numerous morse code repeating call signs between .2 and .5 mHz. I assume they are beacons. When I looked up their country of origin they are coming from all over the world, including Japan Russia China Turkey, Italy, Phillipines,, Chile etc. This part of the spectrum was important in the early days of radio but I cant imagine what beacons in this band would be for now. Does anyone know of a list of these, what their exact location is, what power they are radiating etc? Also below .2 mHz there are numerous odly modulated signals reminicent of LORAN. Does anyone know what these are?

Thanks

Bruce.

Yes, I will correct you if you are wrong...and I am not saying that
I like my 210xlt better than the amateur 2042 because I no longer
have the 2042.

What I was saying is pretty clear...that the sensivitivy sucks on
the RS model, especially in the uhf range. was outperformed by the
210 xlt.

That is what I said.

In addition: if my bc 300 was still working right it would have
been more sensitive too...but it's ill. It works fine for a few
weeks and then gets tired real fast and goes to sleep....

>Leif

I think you'll all find that the *name* of an aircraft is not
too likely to be the same as its radio callsign. Even if the Lockheed-
Martin "Darkstar" could hold a person, it would almost certainly NOT
be using a callsign of "Darkstar".

Example - the KC135's of the 434th ARW(reserve) here at
Grissom AFRB do NOT use "Stratotanker" as a callsign.

My favorite callsign? B52's using DOOM... :-)

Typically, in the past anyhow, the typical aircraft callsign
would be from 3 to 5 letters followed by two digits....and especially
if it was a bomber or tanker. Longer "words" that had no digits
after them were usually ground stations. However there are exceptions,
notably "NIGHTWATCH" and others.

Also, I get the feeling that callsigns that are used on the
GHFS (long range, HF system) can be radically different than those used
on UHF frequencies for short range comms. This would include the
stuff from about 225 MHz to 416 MHz or thereabouts, which I believe
was the original report.

I have strong doubts that anything that was supposed to be that
big of a super secret would have been unencrypted on a common channel.
I can tell you that there are plenty of digital-mode transmissions out
there in mil-com land, and even when they aren't, these guys keep
transmissions SO short and cryptic that for most of us to figure out
who or what they are is pretty damned difficult.

I listen to a lot of tanker traffic, simply because nearly any
aircraft that flies in a military role needs gas now and then; some
of course, less or more than others. You can usually get a feel for
what is or isn't a bit hush-hush by who's talking and who ISN'T talking.
I have had occasion to hear the TANKER talking and all ya get from the other
A/C are mic clicks.....which suggests he doesn't WANT to talk for some reason.

OTOH, those things that are no big deal you can often hear
plenty of chatter.

I'd say that if you hear them making routine transmissions, it
probably ain't a big secret.

I'm using a Radio Shack discone that's installed in my attic. I've read previous comments about this antenna being having poor coverage of the VHF low band but that not the case with mine. I notice a large increase in signal strength at 42 mHZ frequecny which the local State Patrol broadcasts on. I also notice an increase in signal strength in the VHF high band. I'm using the stock RS with no top piece added to increase signal strengh on VHF low.

In Canada, there you are free to sell, purchase, and listen to all frequencies that scanners can receive. This includes the cellular band. However, our law also states, that you can only listen for private, non-commercial purposes, and are under a non-disclosure clause. Basically, you can listen you my personal cellular phone call, but you cannot let anyone else listen, and you cannot tell anyone else what you heard. Pretty easy rules to live by, if you ask me.

Jimmie,
Making a UHF Repeater isn't just a matter of sitting down one day and slapping one together. First of all what frequency are you going to be operating on? Do you have a FCC license? What's the RF output needed? What radio site is required? Who else are you going to be possibly interfereing with? As you can see the list is endless. I would recomend that if you are not very familiar with what you are trying to do NOT to do it! You will best off if you get a radio tech's help in doing so! I have found that simple repeaters are best made from old Micors and GE Exec II'S! They are very easily converted. But you must know what to do. I hope that this helps in you decission in making a UHF repeater.

You need to place all the trunked freqs for that department into one
bank, do not delay any of them and lockout any data freqs, this will
change, hit your scan button a lot when the conversation stops.

I think that this was one of the nicest features about the AR8000; it only took a tiny manual to get the point accross and left the rest to the needs and imagination of the user. I was quite glad that it didn't require a 4 month study course to turn the darn thing on.

> >2) They decide the really didn't want to pay $600 for a scanner.

Sure, buy it, use it, love it..recommend it to your friends and people on the net, increase the user base, see software written, ideas shared, companies formed, profits made, expansion, buying out microsoft.

Sounds like a great reason to spend 600 to me.

: Read The Public Client at http://www.post1.com/~pubclient
: ~~~~~~

The FD uses conventional repeaters on 800 MHz. The PD uses conventional repeaters at around 484 MHz and 506 MHz and simplex in the VHF High Band. [There has been discussion regarding whether or not to trunk parts of the newer 484 system, but it hasn't happened yet].

LA Co has a trunked system for all county agencies EXCEPT FD & SO, and LA City has a trunked system occupied mostly (exclusively?) by parking enforcement / traffic control

I don't think anyone out here expects the city or county public safety agencies to go trunked any time in the near future... [with the possible exception of parts of the 484 system]

Hello

Rene Hagen (hagenr@involve.nl) did it again. He made Semasoft 1.15 wich
you can Register.
Look at my HomePage for the latest version.

http://huizen.dds.nl/~mkalmijn/

Greetings,

Marco Kalmijn

730. AOR 1000XLT Problem

Newsgroup: rec.radio.scanner
Date: 1997-01-08 00:00:00 UTC
From: Illusion Projects <claysher@cei.net>
Message-ID: <32D39C40.5CC9@cei.net>
Source record: 212634

I have an AOR 100XLT.It has quit scanning and searching.It seems to be stuck in manuel mode. The word MANUAL will not go off the screen.Has anybody dealt with this before or no how to fix?

Any help will be appreciated.

Clayton

731. LA Trunked, Yes or No?

Newsgroup: rec.radio.scanner
Date: 1997-01-08 00:00:00 UTC
From: dpinero@pobox.com
Message-ID: <32d3a038.394525166@nntp.ix.netcom.com>
Source record: 212635

I recently read someplace that Los Angeles was smart enough to stay
out of trouble with the new trunking technology. They went to 800mhz
(I think law dictates that all agencies go to 800 by a certain date),
but instead of going trunked, they kept things along a conventional
model. They had a sort of "intermediate" upgrade that spared them
from the disasters of going TOO high-tech. I even heard that they
were determined to stay non-trunked for a good many years.

Now I'm hearing they ARE trunked. I'm confused. Anyone out there
care to fill me in on this! :)

Dave

732. hot scanning on FOX last night

Newsgroup: rec.radio.scanner
Date: 1997-01-08 00:00:00 UTC
From: tyler@cyberia.com
Message-ID: <5b0ahn$6m2$1@news3.microserve.net>

Cross-posted to: rec.radio.scanner,alt.radio.scanner

FOX had on their Tuesday night movie last night with some good scanning scenes in it. I can't remember what the name of the movie was, but the guy was running from the cops in a '71 Challenger 426 hemi. He stopped in at an army surplus store and bought the guy's 12 channel base scanner for his car so he could hear the cops while in route. Gee, I wonder where he plugged it in? Better yet, when the camera was on him and he was listening to the scanner, the LED's were buzzing away just jumping from one channel to the next. Our man in the fast machine was clearly listening to the cops but his scanner was still scanning. What gives? Does FOX really think we're that stupid? Oh yea, they have football now. I guess they think we are that stupid.

Just my gripe for today.

Speaking of "images" what is the frequency increase or decrease that
usually enables receiving cellular without any modification of the
scanner? I've forgotten the number and whether one adds or subtracts
that to the real frequency.

Thanks for your help.

I'm just wondering if anyone has any thoughts on improving the discone. Mine is in good shape except for the cheap long cone rods that extend downward. In the process of tightening them, they loosen from their screw holds in the base of the unit. They're just downright cheap. For $60 I expected a little more. Well, I'm stuck with it now. I was thinking of replacing those cheap hollow rods with solid aluminum rods that I would put threads on to screw into the base. If I do this, would it be better to shorten or lengthen those rods, or should I leave their length alone? Any ideas? Sorry, I already know about the vertical element mod. TIA

: >
: >"Darkstar copies, we'll give you a call when we're done."
: >
: >Anyone know what this might have been?

: Hmmmm... I've heard about the "Darkstar" callsign.... From some sources I
: know.... It possibly referd to the "Aurora project" An ultra-fast (Mach
: 3+), Pulse detonation engine, Air Force Airplane.......... It's
: somewhat shapped like a oblong triangle. Very sleek looking.....
: Supposedly to replace the 3 SR-71 and numerous U-2's the USAF have
: in servive at this time.....
: Possibility????
: you make the call!

Well, back in October I heard "Darkstar" units flying with "Mako" units
from my post in Coconut Creek, FL (15 miles NW of Fort Lauderdale). I heard
them a few times, but since then only "Mako" units. Both were on 138.125
(AM; Channel "Victor 14"), and Mako units only on 250.6 (to contact Avon
Park), 139.8 (AM), and 270.6. Whether this was "Aurora" activity I
don't know. I was told it was bombing activity up at Avon Park.

> to scan and can pick up anything
[snip]

Kind of a loaded question isn't it Mike? Akin to asking someone what the best car is. Ask ten people and you'll probably get ten different answers.

Are you looking for a base unit, base/mobile or handheld?

But let's assume you want very wide frequency coverage and ability to tune AM/FM/WFM/USB/LSB. Scouring the list of current receivers on the market(which are reasonably priced), I come up with :

AOR AR3000A $1000
AOR AR5000 $1900
AOR AR8000 $ 550
Icom R8500 $2000
Icom R-10 $ 700?
Yupiteru 7100 $ 450
Yupiteru 7200 $ 550
Yupiteru 9000 $ 700

Most of these radios will tune from 500kHz or so up 2 or 3GHz. Buy one from a Canadian or European dealer and you won't get any frequency restrictions(i.e. cellular ranges intact).

If you can do without HF coverage(>25MHz), then you don't need LSB/USB which adds the following :

Radio Shack Pro-26 $350
Radio Shack Pro-2042 $380
Uniden BC3000XLT $350
Uniden BC9000XLT $350

These radios are nearly continuous from 25MhZ or so up to 1.3GHz. Again, buying outside the US will give you no cellular restrictions.

And I'll assume you don't want an HF rig because you said a "scanner" and are on rec.radio.scanner. I'll therefor bypass listing such radios made by AOR, Drake, Lowe, NRD, Yaesu, etc.

All the listed prices are rough estimates but should be pretty darn
close to current market values. They'll give you some idea about
what you can and can't afford.

All,

While DARKSTAR has been reported as the callsign for the Aurora aircraft, it is also commonly used by the 552 AWACS from Tinker AFB, Oklahoma. They are in Florida frequently for training with the various fighter squadrons down here, usually using published NORAD frequencies.

Source record: 212645

David:

Thank you Brent et al for your replies.

The CITY of Los Angeles public safety agencies (narrowly defined) do NOT presently rely on any manner of trunking technology.

---- As for the FIRE DEPARTMENT...

Since 1988, the LAFD has used 18 fully repeated and 6 simplex 800MHz conventional (non-trunked) analog (non-digital) radio channels.

The men and women of the Los Angeles Fire Department welcome you to listen in on our agency at work. The -most active- LAFD frequencies are the dispatch channels:

Channel 4 857.9375 EMS Dispatch / South of Mulholland
Channel 7 859.4375 FIRE Dispatch / South of Mulholland
Channel 8 858.4375 FIRE & EMS Dispatch / San Fernando Valley

Channel 9 857.2375 Alternate Dispatch/ Brush, River, etc.

A -full list- of our radio frequencies, Fire Station addresses, as well as a "virtual visit" to our 9-1-1 Dispatch Center or downloadable version of our patch can be accessed by visiting the LAFD's Internet Website at URL:

http://www.ci.la.ca.us/dept/LAFD

For direct access to our frequency page, enter:

http://www.ci.la.ca.us/dept/LAFD/freqncy.htm

*Please note that the URL above is CASE sensitive (LAFD must be ALL CAPS).

Thank you for remembering that the terms "trunking" and "800 MHz" are not synonymous!

The CITY and COUNTY of Los Angeles do maintain 800 MHz trunked systems that (at this moment) are used by ancillary agencies (Parking, Sanitation, Transit, Muni Govt etc.). A complete listing of these frequencies and their users can be easily found in any of the commercial directories that are sold at electronic hobby shops.

Southern California is however extremely congested. It is not inconceivable that trunking technology will expand to many SMR users in the -other- bands in the years ahead!

Happy Monitoring!

Brian Humphrey
Public Information Officer
Los Angeles City Fire Department
200 North Main Street, #900

It is really funny up here in Binghamton, NY. We'll go for coffee at a
local Donut Shop which is located on Main Street, right next door to a
McDonald's. I've had my pocket scanner with me, & we tune in the kitchen &
order window. You'd swear that you're next to a truck stop, especialy with
the language that comes out of the Golden Arches. The customers ordering
cannot hear what the workers say to each other, & none of them realize
that anyone with a scanner can pick them up.
One funny incident that comes to mind is when we're sitting in Brighton
Donuts
having coffee. A waitress is standing by us listening to my pocket
scanner, when she recognizes her boyfriend making time with a female
co-worker while working. Needless to say, someone had some fast talking to
do.
I wouldn't trade the scanner for anything. Beats the hell out of the soap
operas.

Cheers,
Tom

Two meter (144-148 MHz) signals reflect (bounce) quite well, actually.
They also refract (bend) pretty well under the right circumstances.

:>see, there are over 850 cellular frequencies to listen to. Bummer.
:>
:>So, how would someone program a scanner for all of these
:>frequencies? The answer is, of course, you wouldn't. Then what
:>is the answer? Well, you could use, say, a pro-2006/optoscan-456
:>to search a band of frequencies to find out which exact
:>frequencies are used MOST of the time, and then just program these
:>freqs into your handheld. That is IF you were going to break the
:>law, that is :-} Just a thought.
:>
:Or, you could buy an inexpensive scanner like the BC860 XLT, or any RS,
:which allegedly receives cellular in the form of "images". Although I
:would never break the law either, a friend of mine has the attitude
:that "people should keep their g**damn radio waves off my property if
:they don't want me listening". He thinks that since all other radio
:transmissions (ham, police, etc.) are made without any expectation they
:are private (unless scrambled), people who use radio transmitters
:called "cellular" or "cordless" telephones shouldn't have any greater
:rights. I reminded him that Congress disagrees.... He also wonders why
:those people don't have to have FCC licenses and call signs :-)

You could just program your scanner to search between 870 and 890 Mhz.
There are around 670 frequencies in the AMPS system.

Balderdash! Those police cruisers are hitting some mountaintop repeater!
And you are hearing the repeater outputs.....not the inputs.

>I don't think they require the cops in these areas to drive up to
>pike's peak before pressing the little button!!

No, but don't you understand the concept of repeaters?

>All your other points, or lack of, basically state "there's too much
>to consider - sometimes it works, sometimes it don't". This is ok, if
>there are no hard-fast rules on these distances and what to expect, I
>can live with that answer.

Distance is only one of many variables. Out in free space where there are
no obstacles; no mass influences; nothing but space, distance is one of the
fewest variables, also including freqency, Tx antenna gain, Rx antenna gain,
Tx power, and Rx sensitivity. As a radio signal comes in proximity with the
earth....roughly three wavelengths, then frequency drops out as a variable,
but several more enter into the picture. Freznel zone clearance is a fairly
complex one that I dispensed with in favor of keeping it simple.

> It just would have been nice to get it
>without all the fancy attempts at making it vague.

Sorry, pal, but to make it explicit means to whup some goshawful heavy math
on ya......at the unnecessary expense of MY time and your inability to
understand it, and there still will be a number of variables to be taken
into account. It's not vague....it's explicit....but there is no way I can
explain every acre of terrain effect on a radio signal in a message medium
like this newsgroup. It depends on the terrain. There are hard and fast
rules.....just like gravity. But gravity varies with distance from the

center of the earth. Radio propagation differs by a known set of parameters, too. The list is lengthy.....

Like it or lump it as you prefer.......but any radio path between Point A and Point B can be fully and totally analyzed with the result being an extremely accurate model. That analysis is complicated and it definitely varies with even subtle factors such as the composition of the soil over which a signal passes.....in other words, different things happen to a signal as it passes over a mile of sand versus a mile of loam or clay. Water is different still.

I published a spreadsheet model for radio path analysis a year or two ago in Monitoring Times. You are welcome to download that sheet from my BBS or FTP sites, (SPRED1.ZIP), if there is any doubt in your mind as to if I know precisely what I am talking about.....or if you have doubts about your own knowledge of VHF-UHF propagation. I don't know what you do for a living, but I make a living from radio link analysis and design. It's MY business. What's yours?

751. Antenna Gain Question

Newsgroup: rec.radio.scanner
Date: 1997-01-08 00:00:00 UTC
From: fjr3@enter.net
Message-ID: <32d408ae.2985915@news.enter.net>
Source record: 212655

I was looking through the Radio Shack catalog and saw a ham antenna that had a gain of 2.6 dB on 2M and 6.3 db on 440 Mhz. I was wondering if this gain would improve my reception of VHF and UHF public service frequencies. I assume that the stations I receive now would be clearer, but would it increase my receiving range. If so, by how much? Also, if anyone knows another antenna that has better gain on the VHF high and UHF regions, I would like information. This antenna would be mounted in the attic when I have my discone.
Thanks,
Fred

Actually.....the newer corless 900 mhz are more than 10 channels.
Depending on the brand you buy, you can get a single channel or as
much as a 100 channel. My friend next door has a 20 channel (grin)

Got to agree with that. And although some test programs use airplane type, or slang, for callsigns (ex: Hornet, Hawk, and Pogo have at times been used for F-18, T-45 and AV-8B tests, respectively), it's unlikely that a high-security program would avertise their operations that way.

>...these guys keep
>transmissions SO short and cryptic that for most of us to figure out

Rather than for some sinister reason, some pilots consider it good comm ettiquette to minimize chatter during tanking, espectially in multi-airplane flights. It's 'bad form' to be making a transmission on tanker common when the tanker makes a "BREAKAWAY!" call - and you just stepped on it by transmitting. :P This is certainly not a hard and fast rule, just a practice that some aircrews use. Hand, light, and basket signals may also suffice for much of the comm.

Thanks Mike(and Steve Derby) who pointed out that the Pro-25 does
indeed receive 800Mhz. I was at work for the original posting
so could not verify for the Pro-25 and 70. Now that I'm at home,
the catalog does indicate the Pro-25 gets 800MHz(I guess I have
to believe you guys now, huh;-) The Pro-70 does NOT get 800MHz.

I'm guessing that an NMO-34 is for the commercial low band (30 to 50
mhz). A larson antenna for the CB band would be an NM0-27 for the 27 to
30 mhz band.

You know, I'm as po'd as the next guy that our cities are going trunked. But I don't think I'd go as far as this guy. He bought the city's communication tower! To what extent some will go. Here's the story, straight from UPI:

(HOLLYWOOD) - Hollywood police will be able to keep their communication tower after all. Hollywood city officials say following negotiations, dealer Alan Leonard renounced his claim to the tower he reportedly purchased along with a list of scrap materials. It turns out Leonard is a convicted felon out on parole who is under investigation by authorities for possibily cloning Motorola radios and selling the fakes as the real thing.

Just how the still-used tower got on a list of surplus equipment has yet to be made clear. Hollywood officials areN'T sure if it was an honest mistake that was overlooked by the city's purchasing director, of if Leonard attempted to fraudulently obtain it.

Robert:

I have seen fantastic prices on discontinued scanners at times at RS.
It usually is about a year or so after the close out sale.
Most of the time they will have one or two left. Usually it is a display model.
There are four or five R.S. stores close to my home, and it is like being in the
right place at the right time. I usually happen to see one when I
go in to pick up something else.

767. Announcing POCSAG Pager Database

Newsgroup: rec.radio.scanner
Date: 1997-01-08 00:00:00 UTC
From: Dave Evans <Dave@devans.demon.co.uk>
Message-ID: <suMa+XAzau0yEw38@devans.demon.co.uk>
Source record: 212692

Announcing P_Base Version 1.00

For users of PD.exe, the DOS POCSAG decoder, a Windows based companion database shareware program is now available for evaluation.

Visit "www.devans.demon.co.uk" (homepage) or go direct to the P_Base page by adding "/p_base.htm" to the URL.

You can download P_Base and/or PD from the site.

If you're just getting into Pager decoding, you can also learn about POCSAG and link to other sites.

I recently aquired the Pro 26 scanner and believe it to be one of the better hand helds available on the market. Features, as you are aware, are what drive scanner sales and the Pro 26 is packed with everything from variable freq. search speed to exotic cell mods requiring the substitution of "european" hardware within the chasis of the scanner.

With the wide distribution and market saturation only the "Skack/ Tandy" can provide the purchase of other scanner products seems foolhardy- at least where the Pro 26 is concerneed. Your purchase can at least be warranted by a national distridution chain vs. a local independant. In addition, the large number of other units in circulation ensures long term availability of parts, mods, and problem resolution/feedback.

Performance characteristics of the Pro 26 are well within the spectrum the 8000, allthough the 8000 provides many advanced programing options. Question is, will you use these options often enough to warrant the cost of the 8000?

Good luck, let us all know what you decide.

Bill Baker.

Hmmmm... I've heard about the "Darkstar" callsign.... From some sources I know.... It possibly referd to the "Aurora project" An ultra-fast (Mach 3+), Pulse detonation engine, Air Force Airplane.......... It's somewhat shapped like a oblong triangle. Very sleek looking..... Supposedly to replace the 3 SR-71 and numerous U-2's the USAF have in servive at this time.....

Possibility????

you make the call!

Tyler,

The show was a TV remake of a '70's cult movie called "Vanishing Point".

This a was a very low budget project & those in charge obviously don't know the difference to how a scanner operates. For the money & time invested, that is what Fox paid for. It was a visual & sound effects show & it probably looked 'cool & neat' to have the LEDs running.

I would say for about 60% who watched & didn't turn it off or fall asleep, those people don't know a scanner from a 2 way radio.

BTW, you may want to rent the original "Vanishing Point" and "Duel" (one of Spielberg's first movies). Both are entertaining w/o scanners.

No, it wasn't, but that's what the First Amendment is all about. So you don't like Scanner Master. That's your privilege. Wasting bandwidth with multiple reposts of the same complaint is inconsiderate to those who pay for access to the newsgroup. If you want to sound like yet another "I don't like this person/product and I will flame them every chance I get" broken record, you'll get all the respect and admiration that they get from the rest of us.

I had a Regency WHAMMO 10 with the DFS5-K (or whatever it was called) synthesizer for channel 10. In its day and age (1976-77) it was one hot scanner. It also cost me over $300 with the external synthesizer, and that was BIG BUX back then in a different financial era.

I have long since disposed of the pair. It was nice hearing about the combs, and the little tube you use to break off the "teeth" to set individual frequencies!

You may wish to ask Bob Parnass, AJ9S (parnass@lucent.com) if he needs these for his "museum" of over 100 scanners.

The only practical advantage that I've ever found in the Base model vs. a Handheld is the quality of the size(quality) of the speaker. Even this isn't all that much of a difference when you consider we are talking about the limited frequency range of radio systems that are monitored.

(Although I do have a co-worker that keeps on programming FM broadcast stations in our scanner (using FM wide) at work, he says our RS 2006 picks them up better than his FM portable.

I've have six scanners, three are handhelds, they see all my use.

>
> Tyler

Based upon their normal numbering sequence, I would guess it is a low
band antenna with peak tuning for 34 mhz. The 6 meter ant is an NMO-50,
dual band 2 meter 70 cm is an NMO 2/70.

The NMO refers to the type of mount. (New Motorola, I think)

Happy scanning

814. Darkstar

Newsgroup: rec.radio.scanner
Date: 1997-01-09 00:00:00 UTC
From: Scott Cochran <cochran@frii.com>
Message-ID: <32D55F50.243C@frii.com>
Source record: 212489

Well that clears that up. I saw a program on discovery ch about "secret" military planes. A gentleman who is a "big" military air monitor says he monitored & caught on audiotape a plane giving darkstar as an identifier. He then went outside and caught on still photo a contrail that was identified as being from an aircraft going no less than mach 5. The whole program had to do w/ a plane that was triangular in shape and was top secret. After reading the various explanations about "darkstar" call sign on this news group, it makes more reasonable sense now. Anyone else see the program? Thanks....

822. FYI: Uniden debut's TRUNK TRACKER at CES!!!

Newsgroup: rec.radio.scanner
Date: 1997-01-09 00:00:00 UTC
From: Rob Tuckman <rtuckman@earthlink.net>
Message-ID: <32D5BB6E.5A3A@earthlink.net>
Source record: 212497

Uniden has officially introcuced it's BC 235 XLT -The industrie's first 800 Trunk Traking Scanner...

Features...

300 Channels
12 Bands, 10 Banks
Trunk Scan and Scan lists-Scan for activity on one trunk group or create lists of multiple gruops to scan
Trunk Search-Search for and monitor all groups within a trunked system. Lockout unwanted groups during the search and save other groups to scan lists.
Trunk Lockout_ Lockout groups you don't want to monitor including data groups.
Trunk Delay-Apply a five second delay to trunking groups so that both sides of the conversation can be heard, even if the trunking frequencies change between replies.

All you need to do is enter in all of the trunking system's channels and hit search. The scanner automatically finds the data channel and reads out all of the active subfleets. You can save all of some to memory and scan those you wish. It decodes both Type I and II/IIi trunking systems. For type I, you need to enter in the size code. Since most Public Safety is on type II, it's very simple.

Uniden had two working models at the show. Las Vegas only has private SMR's using Motorola protocol, but we were able to listen in and follow the business traffic on the channels.

Motorola is going to SHIT!

The reps said that their legal department has given them the go ahead to roll the units out March 31st..a slight delay...

Suggested retail price will be around $249.00

The unit also does 29-54
108-136
137-174
406-512
806-956 (excluding cellular...)

Comes with 2 nicad packs and a charger...

Look for it!!!

823. Computer Interference

Newsgroup: rec.radio.scanner
Date: 1997-01-09 00:00:00 UTC
From: Ron Gallimore <rgallim@icgroup.net>
Message-ID: <32D5C6AD.74BB@icgroup.net>

Isn't this interesting from the DRUDGE REPORT

GINGRICH'S CELL PHONE NIGHTMARE

Political scandal has come crashing into the digital age. The NEW YORK TIMES kept everyone in Washington, DC up late on Thursday by publishing extended excerpts of an audio tape that captured Newt Gingrich in a conference call with others on the morning of his ethical mea culpa.

The call was picked up on a police scanner in Florida.

The conference call was over how to counter the inevitable Democratic attacks and how to time the admission with newspaper and evening news cycles. The call caught on tape provides top insights into the methods and intensity of spin used to calm and convince the public mass. It is proving to be a complete embarrassment for the Republican leadership.

"Oh my lord -- why is anyone talking on a cell phone," a Republican source on the Hill told the DRUDGE REPORT after getting briefed on the TIMES bullet.

The phone transmission originated from one of the participants in the strategy talk, who was no doubt taking a Christmas break in the sunshine state. Newt was at is home in Georgia; others taking part were in Washington. The TIMES says the tape was given to them by a Democratic congressman who was slipped the goods by a couple in Florida who overheard the call on their scanner. Calling James Bond.

(It should be noted that it is a federal crime to make audio recordings of any and all activities that occur on such scanners.)

Gingrich being caught on tape is a twisted irony. Leading Republicans on Capitol Hill have recently issued warnings to all staffers about the dangers of talking on cell phones in the current partisan-charged Washington, DC atmosphere. The National Enquirer's public announcement that they were soon going to open a Washington bureau also added to the growing cell phone fears.<

Source record: 212502

Dear Friends:

Exactly what -did- a "Hall - Scott" powered Crown Fire Engine sound like?

You've heard veteran Firefighters talk about these legendary rigs, now hear them for yourself.

We are happy to announce an interim update to the LAFD website that includes a very rare audio clip from the early 1960's.

Visit the LAFD's website at:

http://www.ci.la.ca.us/dept/LAFD

Access our Crown Apparatus page that includes a 453K .wav file. This translates to 38 professionally recorded seconds of Hall-Scott powered Task Force 10 responding from their Downtown L.A. Station in the early 1960's.

It took a great deal of digging through the LAFD tape vault to find these, and in our search... we found more cool stuff we hope to add in the future!

Enjoy!!

828. How to record ???

Newsgroup: rec.radio.scanner
Date: 1997-01-09 00:00:00 UTC
From: Marc <edussault@ic-net.net>
Message-ID: <32D583A4.204E@ic-net.net>
Source record: 212503

Hi,

I do have a scanner (Pro-2026) and would like to record activities heard
on it.
How do I do it ??
What equipment do I need ??
I presently have a small recorder which I use with the microphone having
ON and OFF switch on the mic to start and stop the recorder.
When using this equipment it works well with the mic but tried a direct
cable from the scanner to the mic jack on the recorder but guess the
signal is too strong as mostly distortion is being recorded.
What I would like to have is the proper equipment to have the recorder
start only when something is heard on the scanner otherwise it is OFF.

Thanks in advance for the reply.

You will need an attenuating inter-connect cable (can be found at Radio Shack) to go from the scanners line or earphone out to the tape recorders microphone input jack (use the line-in jack instead if it has one and the use of the att. cable may no longer be required).

There are cassette recorders that have a VOX mode - this mode will record something when it goes above the threshold level. As long as your scanner is not sending audio out to the recorder (ie scanning until signal found), the recorder should just be sitting there in record-pause mode. If the threshold is set too high, you will hear the audio start/stop frequently and possibly miss out on some of the action...

Hi, Dave:

The L.A. City Fire Department converted from their old 33 Mhz system
to a Motorola 800 Mhz system a number of years ago. It is not a
trunked system.

The LAPD is in the process of switching to a Motorola Sabre system,
also not trunked, but can be digitized. The LAPD system will remain on
UHF and will suppliment its 506-507 Mhz frequencies with those in the
484 Mhz range. I believe eventually all LAPD comms will be moving to
around 484 Mhz.

For the money, the Grove Scanner Beam is hard to beat. For six times the bucks, a log-periodic might beat it. At twice the bucks, Radio Shack's top of the line TV antenna mounted vertically might beat it.

The singular disadvantage of a beam antenna in most applications is the requirement for a rotator and a slightly more complex installation, but that goes with the turf, so to speak.

> I was looking through the Radio Shack catalog and saw a ham
>antenna that had a gain of 2.6 dB on 2M and 6.3 db on 440 Mhz. I was
>wondering if this gain would improve my reception of VHF and UHF
>public service frequencies.

To some extent, yes. The 2-m ham band is 144-148 MHz, so there should be a little gain above and below that band....but it would taper off rather sharply, the farther away from band center you were tuned. Likewise, for the 440 MHz band'er would give some gain above and below it. In both cases, about the max you can reasonably expect is +/-10% of center freq before the gain falls off to be worthless or worse.

In general, the more the gain, the less the bandwidth. Except in special cases, you don't get to eat your cake and have it, too. .

> I assume that the stations I receive now would be clearer,

That would not be true at all. Clarity has nothing to do with the antenna, unless signals are down in the noise.....in which case they won't break the Squelch. Those that do break Squelch will be clear (or not), dependent on other factors.....not the antenna.

> but would it increase my receiving range. If so, by how much?

That isn't really predictable because range is dependent on many other things, but as a sort of a conversation piece, every 3 dB of gain might result in 10%-25% greater linear range.

>Also, if anyone knows another antenna that has better gain
>on the VHF high and UHF regions, I would like information. This
>antenna would be mounted in the attic when I have my discone.

You'd have to go to a high performance beam antenna to get gain appreciably more than 4-6 dB. That means rotator and external installation. Under the roof or inside the building means reduced performance, no matter what. Get any antenna outside and as high as possible for the most pronounced increase in performance.

Even a dummy load up at 50-ft will outperform a rubber ducky down at ground level.......for all practical purposes.

I have just started in on this fantistic hobby, and I was wondering if a base station with a good antena is that much better than a hand held. Please excuse my ignorence. I live in Toronto And thought it would be kewl to listen to the Buffalo Police, Can I achieve this with a Base station?

>for the most part, it seems like antennas fall into general categories of shape...
>...and then have only minor variations of shape to suit...
>in which case...copying shape shouldn't pose a problem...?...

Ummmmm, copying? No. But there is more to it than at face value.......
like copy a thru-the-glass antenna, and you will end up with a low performer
just like the real thing.

>for these 'gov.' antennas...
>would their ability to acheive low profile be due to material composition???
>...the, apparantly, only other major factor for such...
>in which case...is there a correlation between density and reception...
> i.e.: reception improves proportionally to an increase of antenna density?

Not density so much as disguise, and the quality of the disguise, and the
quality of the antenna beneath the disguise. Like a figerglass vehicle roof
designed to look like a metal roof, under which is concealed the antenna.
Or a camper type vehicle, the upper part of which is a radome rather than
metal.

>would an antenna necessarily need to be of metal???
>...ceramics? composites? glass? plastics?...

Well, it would have to be a conductor.....and a low resistance one, at
that. So glass and ceramics are out except for perhaps a part of the
disguise. But since they're extremely fragile or brittle, other materials

make a better radome or disguised cover. The "beef" is almost certain to always be copper, brass, silver, or aluminum. Perhaps stainless steel in some cases.

>probably ain't a big secret.

True....and the radios are usually timed so that they scan a certain number of frequencies from time to time. The two radios or net are all timed in sequence. So you see, if the operators don't speak short enough, the radio does the job for them. It'd be damn hard to make any conversation out on a secure channel.

Frankly, there is almost no difference other than size between a base scanner and a handheld. If you want to split hairs, dollar for dollar, a base scanner is a little better of a performer than a handheld, but don't take that to the bank exactly. It's just that microminiaturization costs a little more....so a $200 base scanner is likely to have a bit better performance or more features than a $200 handheld. A handheld scanner, however, is not at any disadvantage.

> I live in Toronto And thought it would be kewl to listen to the
> Buffalo Police, Can I achieve this with a Base station?

Base or handheld will not spell the difference. The antenna system might. But there are a number of influences on a radio signal as it traverses a lengthy path. The single most important element of a station is the antenna, and the higher the better.

> wow. no wow. no nuttin'/

Ulp! Gasp! Wheeze!

But say......there are factors worth mention here. Let's take for granted that the PRO-2042 didn't hear certain things. There are two distinct possibilities immediately up on the table.........

1. The PRO-2042 might have been defective.....and deserving of repair. Failures do happen..........rare, though.

2. The Uniden rig was "hearing things". Inferior receivers, as Uniden is extremely guilty of producing, are susceptible to hearing things that are not really there......images, intermod, crossmod, desense....etc.

Uniden is infamous for peddling lots of sizzle at the expense of no steak. Inferior receivers can make superior ones look like turkeys at first and second glances.

I'm not saying this is the case for your situation, but it is always worth a closer look,,,,,Uniden being Uniden and all.......... They will slick ya and make ya feel good abount it. Warm fuzzies and such..........

'Sniff.....

> then there is always DAMARK where you can get scanners
for around a hundred bucks....or a bit more and usually
portables or base stuff....damark is an 800 number order
source...ask em and they will send you their catalogues

the idea of best scanner is relative to how sensitive you
need it. I just tried out a RS pro 2042 and alongside had
my trusty bc 210xlt....the 210 xlt won out ... of course,
800 numbers are available on the 42, but you can get 800
channels in your town without any antennae hooked up...

so key in on "how far away from center command" are you
wanting to listen to?

Also, the more sensitive scanners pick up both sides of
conversations you hear...the further away the action is
occurring on....

In Texas it would be a felony to record what you heard on the phone without the permission of one of the participants. However, balance that with living with yourself if someone really DID get killed and you knew about it in advance. I'd call the police and give them as much SPECIFIC information as possible. I am a police officer and can tell you that we can take action based on anonymous info, but it has to be specific. The more specific the info the more action we can take.
By the way, calls to 911 are recorded and traced. Many police depts have a non-emergency number that is recorded, but not traced. Then there's always you cell phone....

A co-linear antenna might be a good choice for these frequencies. These
can be made inexpensively by stacking 1/4 wavelength sections of coax in
a manner
that the phases add together. You can get pretty high gains with these,
depending
on the number of sections.

I am fairly sure that the ARRL antenna book has this design.

877. homebrew security system using toy walkie-talkies

Newsgroup: rec.radio.scanner
Date: 1997-01-09 00:00:00 UTC
From: parnass@marconi.ih.lucent.com
Message-ID: <5b34v3$8op@ssbunews.ih.lucent.com>
Source record: 212558
Cross-posted to: rec.radio.scanner,alt.radio.scanner,rec.radio.amateur.homebrew

I am posting this for Bret Johnson, who does not have netnews access.

Bret constructed an interesting "border patrol" security system
by modifying children's walkie talkies for use with sensors.

He is seeking circuitry information on the Radio Shack #60-4024
Space Patrol walkie talkies.

If you respond here, Bret won't see your posting, so be sure
to mail him a copy of your response at:

johnsonb@laugate1.lau.aetc.af.mil

Bret describes his system below:

| From: <johnsonb@laugate1.lau.aetc.af.mil> (Bret Johnson)
| Status: R
|
| .... Since my only access to a computer is at work,
| I do not have the ability to interact
| with Newsgroups directly (parts to the program that allow that are
| intentionally deleted from our computers). I personally live
| in a bad area -- on the Mexican border -- which is frequented
| by thieves and transients and use a baby room monitor
| transmiter (housed in an outside electrical
| fuse box) to listen for unusual noises (breaking glass,
| human foot steps at 3:00 a.m., etc.) while I am at home.
| Works well with the exception of
| electrolytic capacitors breaking down (maybe the heat?) prematurely.
|
| I would really appreciate some help on another project of mine,
| even if you could act as an "intermediate" to post it
| to a usenet and forward replies to me (I know -- that
| could be asking a lot!). I have various sensors
| available to place on the "Mexican trails" leading towards
| my home but need a wireless reporting proceedure to alert
| me in advance of the possibility of an "undesireable" visit.
|
| Radio Shack #60-4024 Space Patrol (children's)
| Walkie Talkies fit the bill nicely due to size, power requirements, and
| above all -- cost per unit. Replacing the "rubber-duckie"
| antenna with an appropriate length long wire (and jumpering
| the internal loading coil) solves the range problem.
| Cutting the negative battery cable provides a
| nice place to tie relay contacts from my sensors to (the Push-To-Talk

| button can be locked down in a constant transmit mode on this model)
| and serves to enable a signal to be transmitted only when a
| sensor is tripped.
|
| A slide switch is installed to provide a constant "Morse Code
| tone" upon power connection. (This model is equipped with an internal
| audio oscillator and a Code Key button.) The wires to the
| speaker of the "reporting" radios are cut to prevent
| sidetone and provide a "silent" (from the intruder's
| point-of-view, anyway) alarm. Noisy alarms tend to just get stolen,
| especially if the area is lit well enough for a hasty search.
|
| The problem I have is distinguishing which sensor has
| been tripped by the audio tone (sent by its accompanying
| transmitter). Altering the audio oscillator tone for each
| transmitter and just remembering which tone is
| transmitted from where seems to be the best approach.
|
| Can someone help me locate which parts need to be swapped out
| to alter the tone of the internal code-key audio oscillator?
| I've tried Radio Shack and Tandy National Parts
| but no service manual or schematics seem to exist.
| Thank you in advance.
|
| -Bret
| (Radio Technician in the Armed Services)

Summer heat of 110? You don't know what Summer heat REALLY is. Here at China Lake, the temp rountinely goes above 125 in the Summers. And we are only about an hour and a half North of Edwards. (90 miles due East of Death Valley)

And as far as wind is concerned, , , The Navy measures the wind in "links", , That is, They hang an anchor chain from a flagpole, and then count the number of links that are blown horizontal, , ie; three links is just a gentle breeze.

I'm not sure about "Darkstar", but I DO know that the UAV program at Ft Huachuca was cancelled because of repeated failures. What a shame, , , All they really needed was some good Production Engineering and decent Quality Control, and that program would not have turned belly up. BTW, that drone was one ugly sucker.

Bill Cheek (bcheek@cts.com) wrote:

: Frankly, there is almost no difference other than size between a base
: scanner and a handheld. If you want to split hairs, dollar for dollar, a
: base scanner is a little better of a performer than a handheld, but don't
: take that to the bank exactly. It's just that microminiaturization costs a
: little more....so a $200 base scanner is likely to have a bit better
: performance or more features than a $200 handheld. A handheld scanner,
: however, is not at any disadvantage.

: Base or handheld will not spell the difference. The antenna system might.
: But there are a number of influences on a radio signal as it traverses a
: lengthy path. The single most important element of a station is the
: antenna, and the higher the better.

: Bill Cheek
: COMMtronics Engineering

Another consideration...A base model is great if you just want to sit at
home to listen. A hand-held is great for on-site events like air shows,
races, concerts etc. With an optional, larger, external speaker and AC
power adapter, you can convert a hand-held to a base model of sorts,
although it's less convenient. The advantage remains that you can take the
hand-held with you almost anywhere.

>Good ALL the time:]

Hey Dr. Pepper,

Purple-2 is the new frequency in the 39.0000 range. Base freq is
39.92 and Mobile is 42.28. Your freqs and info is correct as usual
for Purple. Also there is a Purple-1, Base freq is 39.44 and the
mobile freq is the same as Purple-2.

My information comes from METROSCAN Third Edition by Ron Stevens.
I got my copy at HRO is Burbank.

Doctor, Keep up your high standards and I'll be joining you for your
trip in May.

10 - 2 - 4 back at you,

Mike

I just bought a 2035 (same radio with different internal software.) and it slaughters my BC855. I can now listen to both sides of the PD in my county (the '855 only got dispatch) and I can hear police dispatch in the neighboring three counties, too!

I bought two 2035's and one of them is definitely more sensitive than the other, but they do both beat the 855!

Are you sure the attenuator is not switched in on the back of your 2042?

Also, I agree with Bill; my BC855 seems to have *no* image rejection.

I sometimes can monitor FBI, DEA, Customs, ATF, and other federal agencies on my scanner..sometimes the transmissions are encrypted, but on occasion, one of the parties will be transmitting in the "clear" if you listen carefully, you usually can find out waht is going on.

Last night, I think I heard a surveillance relating to suspected drug activity. The agents gave a play by play of where their target moved and what he did....I won't say any more about what i heard because info as such is considered of a "sensitive" nature...

Sometimes I hear similar stuf on the local PD detective frequencies also

antanna range depends on several things
--
height of the transmitting antenna
power of transmitting station
height of receiving antenna
gain of receiving antenna
quality of or amplification of signal by receiver

you can hear aircraft over a much greater distance than yhou can hear
ground stations...yet some ground stations with powerful repeaters or
transmitters can also be heard over great distances

From: "Thomas R. Sundstrom" <trs@trsc.com>
Message-ID: <32D6B3BA.4D8A@trsc.com>
Source record: 212319

I wonder if any can fill in the blanks here. A few months ago the NJTP cars moved off the Troop A frequencies and here's what I found when I travelled to central NJ. They appear to be using discrete frequencies, rather than the trunk system of other NJSP troops.

NJTP Moorestown: 868.4375
NJTP New Brunswick: (among the missing)
NJTP Newark: 868.1375
GSP Bass River & Bloomfield: 866.6125

I haven't figured out what is going on yet, but around exit 8 of the NJTP I hear Newark. Below 5, I hear "Mount Laurel" -- and that was not a dispatch point before -- but I am not sure it is NJTP traffic or other NJSP traffic or something else. Before the switch to 800 MHz, there were the three NJTP dispatch locations above.

So... where is New Brunswick (which may be Hightstown with the recent move of police ops out of the Administration building to a new site)? And what is the story with 868.1375? There used to be two GSP frequencies in the 155 MHz band; what are the other frequencies on 800 MHz?

Thanks very much.

I have heard <channel color> 2 referring to using the dispatch channel as a car to car channel. Or, start searching in the 39.00 Mhz range, they could be changing channels like they did to Orange, Gold, Tan, and Blue here in San Diego.

But it sounds like they are just going to car to car communcations.

Mark,

Why do you not want to pay for a registered version?

Surely the author deserves to be paid for his efforts in making your life a little more interesting?

I bet you would gripe like hell if your boss decided to rip you off and not pay you for your weeks work.

People like you make me want to puke - you expect others to flog their guts out for your pleasure, but at the end of the day, you want it for free.

Come on Mark - Play fair and pay up - dont pirate, or ask others to help you pirate either - dont forget that the auther released it for YOUR pleasure as well as making a bit of beer money too - do you begrudge him that?

Do you realise how long it takes to develope a programme like PD203? I can tell you - it takes well in excess of 200 hours.

I dont know how much it will cost in the USA but in the UK it only costs 20 uk pounds - a very reasonable price too, for a programme that works very well.

I repeat: Come on Mark, play fair.

It by supporting software writters, that they will continue to put very great efforts into producing some very interesting packages. Rip 'em off & they will get fed up and not bother!

If you, or anyone else who wants a good programme to decode pocsag data, you can contact the author direct at:-

pete@bearnet.demon.co.uk

Or by post:-

Try TigerTronics in Grants Pass Oregon. they sell a "modem" that is
software supported for $50 bucks. It will work for packet.

AOR AR 8000 hand held scanner. The scanner is absolutely MINT, in original box with manual, rubber duck antenna, AC adapter/charger, and 4 fresh hi-capacity nicad batteries. Cell band is unblocked, and the SCOUT mod has also been done.

Also, includes the AOR computer interface which allows connection between an AR8000 and a PC, or between two AR8000's.

Also, includes the AOR carrying case.

$525 includes US shipping.

I recently stumbled upon a great idea I thought I might share. I have an old pair of amplified computer speakers I was going to put in my car to improve the sound from my Pro-62 so that it was easier to listen to while mobile. After purchasing a monural to stereo plug to fit into the earphone jack, I got back in my truck which has my protable CD player with the auto adapter kit (one end plugs into the headphone jack and the other is a casette with a wire to the jack.) The big lightbulb came on over my head and I unplugged the adapter from the CD, put the monural adapter on the end, and plugged it into the earphone jack on the scanner. I set the volume on the scanner on 1/4, turned on the radio, slid in the casette adapter, and WOW! I can now hear everything much clearer as I go down the road and I don't have to fumble for the little volume knob on the scanner. I can control the volume on the car stereo, adjust the tone, and with the DC adapter, turn it off and on with the rest of the accessories when I crank up and shut down.

If you don't have the car adapter kit for a CD, many places like Circuit City have them for around $20.00.

Scanning on the road just got easier!

But the people flying it could be asking for an extension on the range.
Just because you are not in the plane doesn't mean you don't need a
clearance to fly in a military range.

Today's news of the interception of the conference call of December 21 involving Newt Gingrinch reminds us all that even though such cellular (we assume it was a cellular interception) calls are convenient, anyone who uses a cellular or simple cordless telephone and says anything over it which may be sensitive or secret is an idiot.

Therefore, at least one of the Republicans involved in that conference call *is* an idiot. The question is: Which one?

My last dealing with whem was several years ago.

I ordered a scanner and they delivered promptly. The radio worked
fine and I never had any problems with it.

The only reason I don't deal with them anymore is I found a local
dealer that matches mailorder prices.

Hi, Matthew:

The problem is most likely the cable. RG-58 is very lossy cable at UHF
and 800 Mhz frequencies. Its ok for short cable runs, but there is
just too much signal loss for anything longer.

From: influx@deathsdoor.com
Message-ID: <32d6a478.4221219@news.whc.net>
Source record: 212344

I am a newbie interested in getting started with this interesting hobby... I've seen a lot of good stuff on the Pro-51 and it seems to suit my needs...

However I would like to be able to purchase the model that allows you to mod the freqs... (as in the text posted all over the internet)... I understand these models are discontinued? Or is it possible I may be able to purchase these still from RS?

Also, is this a good scanner that is portable, but wouldn't have a problem just sitting at home messing around with? It might be fun to hook up to my sound card on the puter as well....

Thanks for any responses!

matt

In reference to the LAFD's latest .wav file, dstark@frontiernet.net (D Stark) wrote:

>I can only get about 10% of the .wav file to come over before the
>transfer aborts.

Sorry to hear about that. The file is quite large (453K) and the server has been inundated with tens of thousands of requests.

I just downloaded the file to double check it. It was slow to intiate download, but the entire file was transferred intact within 3 minutes.

Those experiencing problems may wish to check their hard drive to assure they have available space. Also consider visiting at non-peak hours.

The LAFD website and web file can be accessed at:

http://www.ci.la.ca.us/dept/LAFD

**The URL is --case sensitive-, LAFD must be ALL CAPS!

Big Deal! Politicians figuring out how to spin a news story. I bet THAT doesn't happen everyday. Now if you had a tape of Clinton asking Paula Jones to clean his unit with her dentures that WOULD BE news!!!

P.S. - Is the New York times then guilty of violating federal law by publishing excerpts of what it knows to be a private telephone conversation?

you can do this, but it will be a bit of work. Here is my favorite method of reducing the audio level from the scanner to a point where the recorder will work with it:First, it is known that any voltage, either ac or dc, will divide across two resistors according to their individual resistance. We can take advantage of this fact.

Connect one end of two resistors together, leaving the other ends free. The two resistors should have a ratio of about 100 to 1. What does that mean ? Well, that means that a 100k resistor and a 1k resistor would produce this ratio. Mount the two resistors on a small circuit board , by inserting the free leads thru it and soldering them on the other side (regular perf board will do just fine for this). don`t solder these ends together, just put a little on them to secure to the board.

Now we need an audio cable to go from the scanner to the board, with a plug on one end that fits the jack on the scanner. The other end of the cable doesn`t need anything since we are going to strip it back and separate the shield and inner lead before hooking it to our voltage divider.

We also need a similar cable to go from the recorder to the board, with a cable on one end of which is a plug that fits the recorder mic audio (not switching) jack. Once again, we do not need a plug at the board end, since we are going to strip and separate the leads so that we can connect them to the board.

Now, since you have the shield wires on both sides separated from the inner conductor, and you have them twisted up into wires, I will tell you how to connect them. Take both sheild wires and connect them to the unconnected end of the 1k resistor. This will carry your ground through to both sides.

Take the center wire from the cable that goes to the scanner and hook that to the free end of the 100k resistor. that means the scanner output will be in series across both resistors.

Take the center wire that goes to the recorder and hook that to the junction between the two resistors.

put the recorder in voice activate mode

turn the scanner squelch down till you get a hiss. see if the recorder reels are turning. Now, turn the squelch up until the hiss stops, and see if the reels stop turning. If so, then you have it made. If the reels turn all the time, regardless of squelch, the change the 1k resistor to a 100 ohm resistor and try again. If the reels never turn, then change the 1k resistor to a 10k and try it. One of these arrangments will work with your recorder, guaranteed.

Why does this work ? Well what we are doing is dividing the scanner`s output between the two resistors. With the original resistors, (100k and 1k), only 1/100th of the scanner`s output will appear across the 1k resistor, while 99/100ths will appear across the 100k......

If you change the ratio, then you change the voltage appearing on the recorder side of the hookup. Simple, huh ? But it works like a champ !

928. Re: re PD-203 POCSAG decoder

932. Scanner Volume

Newsgroup: rec.radio.scanner
Date: 1997-01-10 00:00:00 UTC
From: tw <twine@intrex.net>
Message-ID: <32D71891.35B3@intrex.net>
Source record: 212358

To all,

I use my hand held scanner in the house with an external antenna and the output to a mono amplified speaker.

What I want to know is this.... with todayï¿½s technology, does anyone offer a speaker that regulates the volume automatically. This would not be unlike some of the televisions that boast about reducing volume levels when commercials come on.

Iï¿½m sure all of you that read this newsgroup are more than aware of the changes in volume when scanning. It ranges from a modest level you set for the average conversation to an annoyingly loud repetitive bleep or continuous screech

I would pay a premium for this technology if it served my needs directly. This would probably be a single mono powered speaker like I have....but with this enhancement. It might also be in the form of software. Perhaps I could ï¿½listenï¿½ through the computer speakers and have the volume adjusted via software. It seems there would be many other applications other than scanning the air waves and annoying TV commercial volume enhancements.

Any comments or thoughts are appreciated.

Tom

Source record: 212366

I was listening to the frequencies below .55 MHz the
other night and there are about 20 repeating morse
code call signs between .2 and .5 MHz. I assume they
beacons. When I looked up the allocations of the call
signs it appears that they are coming from all over
the world i.e. YMN is allocated to Turkey BRA is allocated
to China JAV is allocated to Japan etc. Does anyone know
why these exist? Does anyone know of a complete list of
them? Also there are some oddly modulated signals between
.15 and .2 MHz. They sound something like LORAN. Does
anyone know what these are?

Thanks
Bruce

>
Hello,

The automobile coax may be 75 ohms but for reception anything between 50 and
75 ohms will work. What is important is low loss characteristics. Someone
said the RG58 you used might be the problem but for the short run your probably
using I doubt it.

The car radio antenna is going to be a comprimise at some frequencies but it should
work reasonably well at VHF frequencies if you are connecting directly to it. If you
are using one of the adaptors then I'm sure this introduces loss but allows you to
continue to use the car radio with little affect on it's performance.

Some questions: Does the antenna otherwise work well with the car radio? Do you have
a paging car alarm sharing this antenna? How about a cd rf modulator?

At certain frequencies you should get better reception than the rubber duck.

Good luck,
Rick

Darkstar is the call sign of the Aurora that Pierre Salinger was flying when he launched a Genie at the TWA 747, while flying from a pre-designated orbit at FL350 over Whitewater, Arkansas; in a four ship flight with wingmen OJ Simpson, Jack Ruby and Andrea Wood.

Oh. Well, there are no published "mods" for the PRO-42. In any case, "frequencies" would not be possible, nor would extra memories.

A speedup is possible. Find the clock resonator....determine its frequency, and replace it with a quartz microprocessor crystal about 25%-50% faster than stock. Strongly suggest you get the service manual before attempting anything weird..... Tandy National Parts: (800) 442-2425.

RG-58 is grossly inferior at frequencies above 20 MHz. It should never be used for scanners, and especially for UHF reception.

RG-6 satellite cable is an excellent alternative. You'll need to put gold plated "F" connectors on each end, and then at the scanner end, use an F-to-BNC adapter to mate with the antenna jack. At the antenna end, get an adapter for whatever it takes to mate the F connector to the antenna connector.

I have owned the PRO-2045 for several months now and I am very pleased
with it. I use it as my 'computer desk' scanner and it gets a lot of
use. Even with the 'back-of-the-set' antenna, the receiver is very well
behaved. I am disappointed that it does not have a speaker jack, but
that is not a biggie. The speaker is top-firing.

I saw it and thought it was interesting. It seems like the fella who saw the contrail (and the producer of the show) didn't bother to see if Darkstar was a callsign used by someone else.

Seems to me like he heard a couple of AWACS on the scanner (no telling how far away they were) and saw a funny contrail in the sky and figured they were related.

If you are willing and able to bulk copy all of the media and ship it,
I would be willing to take the time to screen it all and convert the
really good stuff to .wav and RealAudio formats.

Reply to nf2g@ggw.org if interested.

Scanner was a PRO-2004, antenna was a RS discone in attic. I came across the frequencies by accident - I entered several Secret Service freqs when candidates were in the area, and started hearing activity on 138.125 AM. I figured maybe it was part of the security detail, but the activity never stopped. They gave out the frequencies 250.6 and 270.6.

I wouldn't know where to recommend a good freq source, in fact I wouldn't mind having one myself. Try e-mailing Larry Van Horn, steditor@grove.net. He does MT's utility column, and I sure he could recommend a good source.

>I have RG-58 cable and am considering switching to RG-8 or RG-6 cable.
>Is it worth spending the money on RG-8?

No, no, no, for the luva Pete, no! RG-8 in most of its forms and styles, is
very lossy, too. Avoid it like the plague for VHF-UHF applications.

> Or would I notice a difference on switching to RG-6 on a 50' run?

You would note a difference, especially at UHF and up.

> The reason I haven't decided yet was RG-8's being somewhat inflexable.

It's flexible enough. That ain't the problem. RG-8 is lossy at VHF and UHF
frequencies.

> How does most people mount rg8 to handheld from antenna on roof?

There are a zillion adapters available for any need and purpose. For VHF
and UHF in RG-8 sized cables, it's best to install Type N connectors on each
end, and then get a set of adapters to fit whatever is at each end. BNC
adapters are common.

But there is only one RG-8 sized cable worthy of a scannists' attention,
and that's Belden 9913.....and heliax cable, of course. Otherwise, RG-6
satellite cable offers a lot of bang for the buck.

> Do most people run RG-8 from antenna on roof to a wall jack using
> BNC quick disconect male and then run a short piece of RG-59 from
> wall to handheld or base scanner?

A serious scannist won't do anything like that. No serious radioist would
do that. Instead you can get right-angle adapters and a host of things to
uncomplicate your situation. But never mix/match coax cables, and never

splice coax cable, either.

Good point. And add to it that a handheld makes for a fine mobile scanner,
too. The only snag there is sometimes the audio isn't loud enough, in which
case an amplified speaker works wonders.

WA2ZKG from WB9OMC. :-)

my scanner for UHF milcoms is a Rat Shack PRO2006, no longer in production unfortunately but I am pretty sure that their newer top dog will also snag that band AND has an added feature - a tuning dial, so that you can rotate the knob and do a "manual scan". Might sound archaic to a lot of people but is actually quite useful. There are also several other brands of scanner that will pick up the UHF mil av band. Ya usually have to go top-of-line to get it, though.

Antennas are generally pretty easy; you can find a decent discone at Rat Shack. Even their simple ground plane will work.

Check in on rec.radio.scanner if you want additional specifics.

As for freq. sources, I highly recommend Steve Douglas' book on Military Monitoring, which I *think* you can order from Grove....who just happens to have a web page. A search on "Grove" should locate it for you. Grove, BTW, is also another source for radios and antennas.

Dirty trick dept. :-)

VHF/UHF TV antennas will make a workable receiving beam antenna, all ya gotta do is rotate them 90 degrees so that their elements sit vertically instead of horizontally !! While this won't help you a lot for aircraft (unless you plan on having a pretty mongo el-az rotor assembly), they are SUPER if you live near a base or other comm. installation. Just point the antenna right at the installation and you will probably do a LOT better than just an ordinary omnidirectional scanner antenna will. A further hint in this dept. - Rat Shack has some BIIIIG UHF-only antennas that have some pretty good range figures. I am working on one right now to convert the boom mount for vertical use; but be prepared to need lots of room for some of these. The one I bought is about 10 feet long!

I have RG-58 cable and am considering switching to RG-8 or RG-6 cable.
Is it worth spending the money on RG-8? Or would I notice a difference
on switching to RG-6 on a 50' run? The reason I haven't decided yet
was RG-8's being somewhat inflexable. How does most people mount
rg8 to handheld from antenna on roof? Do most people run RG-8 from
antenna on roof to a wall jack using BNC quick disconect male and
then run a short piece of RG-59 from wall to handheld or base scanner?

It's not as bad as everyone is making it out to be.

YES they are better one's to be had.

First take advantage of what you have and mount it as high as you can.

DO NOT USE RG58 coax. The higher you go in freq. the better the coax you need.
The biggest problem with the coax is what you need is to BIG and to EXPENSIVE.
ie: 9913 coax.

I have found that a good quality RG6u quad shield cable is a good compromise.
I use a Grove Pre-amp ($79.95) with the amp at the antenna end and the control head at the radio.
I also have had very good luck with the Radio Shack ($29.95) in line amp used for sat.dish installations.
The RS unit will pass thru any thing below 45o MHz aprox (I use this mobile).

You can screw a low band stinger antenna on top of the RS DISCONE, it should help.

Just changing your coax should make the biggest difference.
Don't worry about to impedance difference in the cable, from the receiver. It won't any difference. It's so slight and your asking the receiver to cover a extremely large freq.range. No antenna and cable would be in the complete band spread.

Good Luck

From: "Thomas R. Sundstrom" <trs@trsc.com>
Message-ID: <32D6B3AF.37BF@trsc.com>
Source record: 212418

I wonder if any can fill in the blanks here. A few months ago the NJTP cars moved off the Troop A frequencies and here's what I found when I travelled to central NJ. They appear to be using discrete frequencies, rather than the trunk system of other NJSP troops.

NJTP Moorestown: 868.4375
NJTP New Brunswick: (among the missing)
NJTP Newark: 868.1375
GSP Bass River & Bloomfield: 866.6125

I haven't figured out what is going on yet, but around exit 8 of the NJTP I hear Newark. Below 5, I hear "Mount Laurel" -- and that was not a dispatch point before -- but I am not sure it is NJTP traffic or other NJSP traffic or something else. Before the switch to 800 MHz, there were the three NJTP dispatch locations above.

So... where is New Brunswick (which may be Hightstown with the recent move of police ops out of the Administration building to a new site)? And what is the story with 868.1375? There used to be two GSP frequencies in the 155 MHz band; what are the other frequencies on 800 MHz?

Thanks very much.

From one of the FAQs:

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S

[...]

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there
is no audio and the green backlight no longer functions, a
tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201
(2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC
to several stages of the BC200XLT. Its main purpose is to
switch off power hungry stages of the BC200XLT when the CPU
thinks the NiCd voltage has fallen below a threshhold.
That's an attempt to limit the current drain on weak NiCds
to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board,
adjacent to the black multi-pin connector which mates the
Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily,
by something in the scanner drawing too much current
through it. In one case, capacitor C36 shorted. It's a 220
uF 10v electrolytic, located on the component side of the
main board, connected from pin 8 of the audio IC (IC2
NJM386SL) to ground. In a pinch you bypass Q201 by
soldering a short piece of bare wire between the collector
and emitter.

I checked them out last night and today. Left the RealAudio connection open while I was doing some light-duty searching through DejaNews. Pretty interesting. I take it this is just one channel of the Dallas Police Department? I would assume that a city the size of Dallas would have a couple dozen channels, and probably be trunked (as is the case here in Indianapolis, where we have 24 trunked channels).

It is an interesting site; hope they get more cities soon. Thanks for posting it.

Ive got a problem with my discone antenna.

It picks up VERY well on VHF freqs but not very good on UHF freqs.
(around 460mhz) Quite often my rubber ducky antenna is better!

Im using rg58u type coax (about 10 metres) Someone once told me that the
coax didnt have the best shielding or something like that but it was
tested with a multimeter and was ok.

Any ideas? Should I buy new coax?

Many Thanks

Matthew

PS I live in a big city so signal strength is not a problem.

Percon can only list those freqs that have licenses, while Monitor America relies on more sources such as monitors and direct research.

If the frequencies in use are not listed in the Spectrum, then it is unlicensed. If it is unlicensed, then report it to the FCC, not PerCon.

While there are some errors in Spectrum, the error rate is so low as to be neglible.

It can be programmed by a computer, but once it is programmed, then you can only control it thru it's control head.

While I can hardly be subjective, I think it is great! I will be happy to give you details in private E-Mail if you want more info about the book, or send you excerpts.

If you want things like PL tones, channel numbers, or codes, then this will help you. If all you want is a list of freqs, then there are cheaper alternatives.

Feel free to email me direct for specifics if you wish!

ICOM IC-R7000 RECEIVER ANTHOLOGY

Compiled by Bob Parnass, AJ9S

EXAMINING THE ICOM IC-R7000 RECEIVER

Copyright 1986 by Bob Parnass, AJ9S

The long awaited ICOM R7000 is here. I bought my R7000 (S/N 001400) on June 14, 1986 from Spectronics, and agree with other R7000 owners: ICOM did their homework on this radio.

I had several questions about the R7000 that were not answered in ICOM's advertisements, and could only be answered by fiddling with the real thing:

1. Can one set the R7000 to behave like a "normal" scanner, waiting for a transmission to complete before resuming the scan? Contrary to the review in July Monitoring Times, the answer is YES. There are 4 choices of when to resume scanning (or seaching), and this is one of them.

2. Does the R7000 have a "search and store" mode, like the old Bearcat 250? Yes, and it's well done. There is a mode which will search between two frequency limits, and store the active frequencies in the top 20 channels. The R7000 is smart enough not to store duplicate frequencies.

3. Does the R7000 use the concept of a "channel bank"? Yes, one can select and deselect any of the 99 channels to be in a bank. This is much more flexible than traditional scanners. For example, the user can form a bank composed of channels 2, 5, 31, 48, and 79.

4. Does the Priority Scan feature work like a Bearcat scanner? Well, sort of. The best way to describe the ICOM R7000 priority algorithm is to say is resembles using a Bearcat scanner in the manual mode with the priority feature selected. One cannot "scan" more than one channel on the 7000 while sampling the

priority channel. On the plus side, the priority frequency does not use up any of the 99 channels, but is programmed from the keyboard and has its own register. The user can use the "scan speed" control to set how often the priority frequency is sampled, a

nice touch. In practice, the R7000 dwells on the priority frequency for a little too long, essentially chopping up the signal on the non priority frequency too much.

Using the internal, top-mounted speaker, the R7000 has good audio power and fidelity, better than my R71A.

The user manual is generally good, and a schematic is furnished. Some broken English makes it unclear as to whether the R7000 battery backed up RAM contains firmware as in the R71A.

There are provisions for activating a tape recorder when a signal is received, but there is about a 1 second delay in activation, causing the recorder to miss the start of the transmission. I may replace the capacitor in that relay circuit when I get the nerve to open the cabinet for the first time.

Another relay is used to switch in some filters for reception above 512 MHz, so one hears the relay clicking while scanning a mixture of low and high frequencies, a bit unnerving.

There's a lot of fun to be had with the R7000. It was interesting tuning through the link and paging signals in the 72-76 MHz band, and listening to military aircraft in the 200-400 MHz band.

My UHF antenna system consists of a government surplus FAA discone, good for coverage between 150-1200 MHz. Although not as good as a Butternut SC3000 antenna in the 150-174 and 440-512 MHz ranges, the discone has the edge in the 225-400 and 512-1200 MHz bands. At these frequencies, a low loss feedline is very important, and I use a Belden 9913 clone made by International Wire and Cable.

COOL YOUR ICOM R7000 RECEIVER WITH ANOTHER HEAT SINK

Copyright 1988 by Bob Parnass, AJ9S

[NOTE: This article was published in the November 1988 issue of The Radio Enthusiast and the February 1989 RCMA Newsletter.]

The new ICOM R7000 25-2000 MHz receiver is a super radio, but the power supply tends to run hot. The two biggest

- 3 -

heat generators are the pass transistor and bridge rectifier module. The stock heat sink, a flat piece of metal bolted to the inside of the cabinet rear, is inadequate. After 30 minutes of use, the back panel gets very hot, and the entire cabinet warms.

I added a small heat sink to the outside of my radio, using the screw that holds the bridge rectifer to the stock heat sink. An application of heat conductive grease between the added sink and the cabinet helps the heat transfer process. Now the rest of the cabinet gets barely warm to the touch.

ADD A COOLING FAN TO YOUR ICOM R-7000 RECEIVER

by Brian Kantor, WB6CYT1

In my R-7000, adding a fan makes a big difference. I've had it on continuously for three days now, and it's still nice and cool. Turns out most of the heat comes from the transformer core in the AC supply. One of those 3-1/2" 12V DC fans fits just nicely - a pair of 1/4" standoffs screwed through two of the upper back panel ventilation slots holds it in place, the power leads snake through the lower ventilation slots, and some duct tape to form a gasket, and it pulls the hot air right out. If you pick the 12V off the power supply regulator board at W3 (orange lead), it will even work properly when you run the radio off 12 volts.

[In order to blow hot air out, the fan must suck in cool air from somewhere. Users are advised to be on guard for dust being drawn into fan-equipped R-7000s. - Editor]

TV INTERFACE FOR R7000

John Biro

I just got the video interface for the R7000, and to my surprise it is not an internal option. It bolts to the

---

1. Brian Kantor, WB6CYT. University of California San Diego. ARPANET address: brian@ucsd.edu

- 4 -

side of the radio (right side were the rubber feet use to mount). It is about 1 inch wide, and the same height and length as the R7000, and in a matching cabinet.

TV video is taken off the 10.7 MHz IF output jack, this presents a problem if you are using it for a Band Scope. It also "steals" the power from the IF output (the center pin of the IF out carries 12VDC so be careful not to short it out).

The interface provides RCA type jacks for both Video out and Audio out. The Video is standard levels and the Audio is low level output for input to a typical audio amp (it can not drive a speaker directly). I am not sure why the audio output is there as you can monitor the audio on the R7000, looking at the circuit they do have a sideband filter circuit so I would assume the audio is cleaner but I have not tried it and do not have any problem with the R7000 audio receiving WBFM from the TV stations.

Results: The TV-R7000 works OK, but I am just disappointed in the fact that it does not mount internally in the R7000. This could also help in its high price tag of $119. I had a Yaesu FRG9600 with video option (only about $30), and it worked about the same. The picture quality is good, and it is very stable. My antenna is vertically polarized, so I am working crossed polarized for TV stations but still get good results, strangely better on UHF then VHF freq. In fact, I get UHF on this set up better then my late model TV upstairs.

I think that I am most disappointed in the fact that the unit mounts on the side of the R7000. I don't have the extra inch of bench space, so I had to put rubber feet on the unit and lay it on its side on top of the R7000. It works fine and I do not see any difference with the case of each unit tied together or not.

I made a "T" adapter and ran both the BAND-SCOPE and TV on the IF output. I have not tried to add a third option to the IF output yet but it seems to be buffered from the main IF (wide band data 9600 baud).

The unit comes with schematic, installation info, and cables to hook it up to a video/audio monitor. Installation is 5 minutes or less if you know where to find your screw driver the only tool required.

Now to look for some Amateur TV and for Hidden TV stations. There is more out there then featured in the TV Guide.

- 5 -

198 CHANNELS FOR YOUR R7000 RECEIVER?

Copyright 1988 by Bob Parnass, AJ9S

[NOTE: This article was published in the April 1988 issue of The Radio Enthusiast.]

The ICOM R7000 appears to use a uPD446C, 16K static RAM chip, for storing 99 memory channels. By looking at the pinout of this chip (IC8 on the Logic Unit) in my service manual, it appears that ICOM is only using 1/2 its memory capacity. Address lead A10 (pin 19) is soldered to a ground pad.

To double the number of memory channels in the R7000 to 198, it looks like one could "lift" pin 19 of IC8, and connect it to pin 24 (+Vcc) through a 10,000 ohm resistor. A SPST switch could be used to ground pin 19.

Another challenge would be finding a place on the R7000 to put the added "Memory Bank" switch. Perhaps one could use the Noise Blanker switch, and just leave the NB on at all times.

I don't have time to try this experiment, and would be interested in hearing results from any enterprising hobbyist willing to try this.

Long live tinkering!

[PS: Jack Albert, WA9FVP, reports that he tried the modification, and it works! Jack doesn't have the remote control option in his R7000, so he elected to use the front panel REMOTE switch as a bank switch. He installed a 48,000 ohm resistor between IC8 pin 19 and ground, and ran a wire from the REMOTE switch, through an 82,000 ohm resistor, to pin 19. When you switch between banks, you must also rotate the channel selector knob, forcing to the microprocessor to read from memory.]

DOUBLE THE MEMORY CHANNELS OF THE ICOM R7000 BY REPLACING THE SPEECH SWITCH

by Jean-Louis Ecochard

This modification is based on information received both from Bob Parnass and from Gary on the ICOM Technical

Support line.

Although simple, this modification is rather delicate to implement because it requires knowledge of unsolder- ing and soldering CMOS components. It also involves removing the speech switch. This will of course void any ICOM warranty and the result may be a very expen- sive paper weight. It is very important to note that some vendors of ICOM equipment offer a similar modifi- cation for ~$50.

WARNING

THIS OPERATION INVOLVES UNSOLDERING ONE LEAD OF THE CMOS MEMORY CHIP. CMOS DEVICES ARE EXTREMELY SENSITIVE TO STATIC ELECTRICITY. USE THE APPROPRIATE EQUIPMENT SUCH AS GROUND STRAP, GROUNDED SOLDERING IRON, ANTI STATIC MAT TO MAKE SURE YOU WILL NOT DAMAGE THE CHIP.

THE SILK SCREEN REPRODUCTION IN THE ICOM R7000 SERVICE MANUAL IS INCORRECT, REFER TO THE FOLLOWING DOCUMENT CONCERNING LOCATING THE POSITION OF THE SPEECH SWITCH. CONTACT ICOM FOR MORE DETAILS.

Equipment

anti static mat
ground wrist strap
tip grounded soldering iron
solder (thin)
set of screwdrivers
unsoldering pump
set small pliers wire cutters

Parts

photocopy of the exploded view of the R7000 from the ICOM R7000 service manual
remote switch ICOM part # SPUT 19167A
47 K Ohms resistor
small insulated wire

Time 2 to 4 hours

Preparation

Read this document completely. Select a smooth surface to work on such as an antistatic mat or a towel spread on a

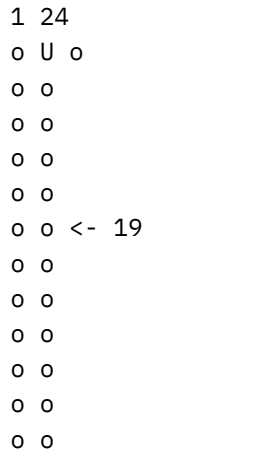
table. Put the R7000 in front of you with all the equipment you will need at reach. The receiver must be unplugged. For safety reasons and protection of your equipment it is advisable that you leave the ICOM unplugged for a couple of hours to allow components to cool and capacitors to discharge. Take off the front panel and the bottom panel as described in the exploded views of the service manual. Disconnect and take off the logic board (remember the connector positions). Disconnect and take off the SW3 board it may require disconnecting other boards.

The memory module

Locate IC8 on the logic board. It is the chip with the battery on top of it. Locate pin 19. Use the reference in the

service manual to find the correct pin labeled A10 (page 7-9).

Top view of IC8

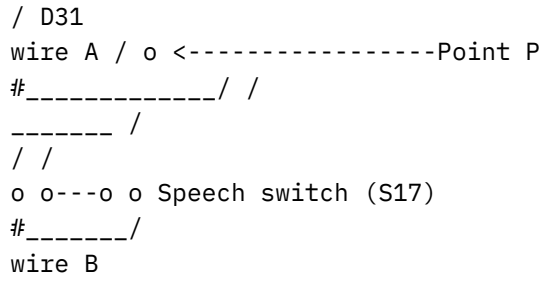


Now think on how difficult it will be to unsolder pin 19. If you think it is beyond your skills, get help. Unsolder pin 19 and use a pair of small pliers to pull it out of it hole. Make sure it does not touch the transistor nearby. solder a wire to pin 19. this wire must be long enough to reach the front panel later on. When this is done, verify that pin 19 is not in contact with anything (you may want to isolate it). You have done the most difficult part of the modification.

The switch board

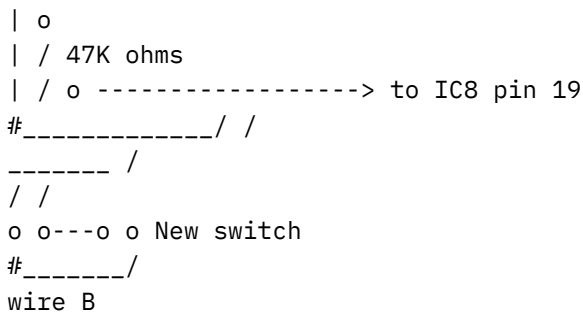
Locate the speech switch on the SW3 board. Beware, the ICOM service manual has incorrect information (reversed) concerning the placement of switches on SW3. The speech switch is S17. Locate the pattern/trace below on the solder

side of the SW3 board.



Unsolder the speech switch, the diode D31 and the wire A. Insulate the wire A so that it does not touch any- thing. Solder the 47K ohm resistor where the diode D31 was. Solder

the new switch (SPUT 19167A) where the speech switch was, in the same position. Solder the wire that you have previously soldered to IC8 pin 19 to Point P. Solder a wire between where wire A was sol- dered and ground. A good place to connect to ground is around the screw next to S18 on the SW3 board.



Verify your work and reassemble the unit.

Results

In the "out" position, the switch gives you the original 99 memories, in position "in" you have 99 more memories. These memories will be most likely full of garbage, so the first step is to clear them using the clear switch. Clear all the 99 memories. This modification also double the program scan mode memories. For example, you can have two programmed scan depending on the position of the switch when you do a "SET".

MODIFY YOUR ICOM R7000 TO SCAN AND SEARCH FASTER

Copyright 1986 by Bob Parnass, AJ9S

[NOTE: This article was published in October 1986 Monitoring Times magazine, page 28.]

This article describes how to increase the scan and search speeds of the ICOM R7000 receiver by 60% without noticeable performance degradation.

Background

The front panel SCAN SPEED control on the R7000 receiver allows the user to adjust the speed of scanning and searching operations, as well as the rate at which the priority channel is sampled. Rotating the control counterclockwise decreases the speed, and rotating it clockwise increases the speed.

When the SCAN SPEED control on my R7000 (serial number 001400) was turned fully clockwise, the radio would scan a maximum of about 8 channels/second, or search about 8 increments/second. As the following table shows, the stock R7000 can scan about as fast as a Radio Shack PRO-30 or PRO-2003.

Table 1. Maximum Scan Rates of Selected Receivers

Scanner	Maximum Scan Rate (channels/second)
Kenwood TR-2600	1.2
Radio Shack PRO-30	8
Radio Shack PRO-2003	8
ICOM R7000 (stock)	8
ICOM R7000 (after modification)	13
Regency M400	13
Bearcat 20/20	15
Bearcat 300	15

R7000 Scan Circuits

The scan rate of the R7000 is determined, in part, by a simple clock outside the microprocessor. The front panel SCAN SPEED rheostat and resistor R18 (and other components in the LOGIC UNIT) control the speed of this clock. The

clock output is connected to what appears to be an input port on the microprocessor. The upshot is that we can affect the scan rate without affecting the other chores performed by the microprocessor.

The modification consists simply of soldering a 470,000 ohm resistor across the leads of resistor R18 on the LOGIC UNIT circuit board.

How was the value of 470,000 ohms chosen? Experimentation with different resistor values showed that for values both above and below 470,000 ohms, the R7000 scan rate decreases. Not having the R7000 Service Manual, I assume this can be explained by the firmware within the microprocessor associated with the scan rate input port.2

Adding the 470,000 ohm resistor in parallel with R18, rather than just replacing R18, has a few advantages:

1. The modification is easily undone, returning the radio to stock condition.

2. The LOGIC UNIT board does not have to be removed, as would be the case if R18 was unsoldered from the foil side.

Making the Modification

Accessing this circuit board is not difficult, and involves the same steps used when installing the optional Remote Controller or Speech units.

Use a towel to cover your work area to avoid scratching the R7000 cabinet. Unplug the R7000 from the AC line, and turn the radio upside down. Remove the bottom cover by removing the 12 screws holding it in place.

Remove the 4 screws holding what ICOM terms the "partition panel". Pictures on pages 32 and 34 of the R7000 Instruction Manual show the partition panel. After removing this

---

2. Perhaps the firmware polls the scan rate input port infrequently. Another possibility is that the scanning pulses interrupt the processor, and the interrupt firmware is limited in its ability to process frequent interrupts.

panel, the component side of the LOGIC UNIT circuit board is accessible.

Locate R18, a 270,000 ohm 1/8 watt resistor, near connector J5. You may wish to remove plug P5 from J5 temporarily if it gets in your way. Carefully solder a 470,000 ohm resistor in parallel with R18. I used a 1/4 watt resistor as it was the smallest on hand.

Reassemble the radio, connect it to AC power and antenna, and enjoy.

In the modified R7000, the scan and search rates are still adjustable using the SCAN SPEED control. With the control turned fully clockwise (maximum speed), the modified R7000 scans at about 13 channels/second and won't miss weak signals.

A LOW COST PANADAPTOR
FOR THE R-7000

Copyright 1987 by Bob Parnass, AJ9S

[NOTE: This article was published in the July 1987 issue of The Radio Enthusiast and the March 1988 RCMA Newsletter.]

A panadaptor, or spectrum display, is a device which portrays visually the signals in a part of the radio spectrum. Panadaptors allow radio listeners to "see" activity on a portion of band without requiring the listener to tune the receiver.

They are useful for detecting the presence of spread spectrum signals or "hidden" signals riding on a subcarrier of a main channel. Panadaptors are invaluable for detecting spurious emissions from transmitters, and unwanted products caused when 2 or more signals mix.

Panadaptors most often employ a cathode ray tube (CRT) for the display, and must be connected to the intermediate frequency (IF) amplifier stage of a receiver, at a point before filtering takes place.

The ICOM R-7000 2-2000 MHz receiver rear panel has a phono jack for wide band 10.7 MHz IF output. A DC voltage is also present at this connector and is used to power an ICOM TV accessory.

- 12 -

I've seen mention of 3 panadaptors for the R7000:

1. John Biro's article on retuning a Yaesu YO901 Multiscope panadaptor for 10.7 MHz, restricted bandwidth use. Selectable bandwidths of 20, 100, or 200 KHz are available.

2. The Sherwood Communications SCA-7000 signal monitor, priced at $1600, and reviewed in May 1987 "Monitoring Times".3 Bandwidth adjustable from 1 KHz - 1 MHz.

3. The Spectra-Display, priced at $350, which requires use of an external scope.4 Bandwidth adjustable from 200 KHz - 10 MHz. Optional preamplifier required for 12 MHz wide sweep.

In the past month, several Kenwood SM-220 monitor scope/panadaptors have appeared at hamfests selling in the $200 to $250 range. The Kenwood SM-220 can display transmitted or received signals. To add spectral display capability to the SM-220, one must purchase the optional BS-5 or BS-8 module, which consist of a printed circuit board, a steel enclosure, interconnecting cables, and a new graticule. The panadaptor module mounts inside the SM-220 cabinet.

The BS-5 is used with the TS520 and TS530 transceivers, which have an IF of 3.395 MHz. The BS-8 is used with the TS820 and TS830 transceivers, which have an IF of 8.830 MHz. Since the IF of the ICOM R7000 is 10.7 MHz, one must

alter the panadaptor circuitry to accept 10.7 MHz input.

If you have any choice in the matter, get the BS-8, as it requires fewer changes than the BS-5, and may even require no changes at all!

The panadaptor module circuit consists of several stages, but only two are directly related to the IF frequency:

1. A crystal oscillator is used as a marker generator.

---

3. Sherwood Communications, 1310 Industrial Highway, Southampton, PA 19866. tel (215)357-9056.

4. Spectra-Display is sold by GTI Electronics, RD 1 Box 272, Lehighton, PA 18235. tel (717)386-4032.

2. A voltage tuned oscillator is swept across the IF of the receiver, and employs a varicap diode, an inductor and capacitors.

The marker generator is not vital for panadaptor operation. It merely provides a single "pip" that one may use to center the display on the CRT screen, and is similar in purpose to the crystal calibrator in older receivers.

The marker generator circuits in the BS-5 and BS-8 are identical except for one crystal. One need only replace the 3.395 MHz crystal (in the BS-5), or 8.830 MHz crystal (in the BS-8) with a 10.7 MHz crystal to adapt the SM-220 marker to 10.7 MHz IF. I did not alter this stage, although I would if I had a 10.7 MHz crystal handy.

The voltage tuned oscillator is the stage that deserves our attention. The changes required depend on whether you have the BS-5 or BS-8 panadaptor module.

Changes for BS-5 Module

Change the following capacitors:

1. C231 from 1000 pf to 68 pf.

2. C232 from .01 uf to 1000 pf. (You can use the capacitor which used to be C231.)

3. C234 from 100 pf to 22 pf.

4. C236 from 47 pf to 22 pf.

5. C237 from 680 pf to 100 pf. (You can use the capacitor which used to be C234.)

Solder a 10 microhenry inductor in parallel with L204, a 20 microhenry inductor.

Changes for BS-8 Module

I haven't tried the BS-8 module, but encourage you to try using it as is, without modification unless necessary.

These steps are needed only if you cannot find settings of the side mounted aligment controls that get the display to behave as specified in the owner's manual:

- 14 -

1. Remove C233, the 33 pf disc capacitor, from the printed circuit board.

2. Replace coil L204, the 4.7 microhenry inductor, with a 6 or 7 microhenry inductor.

Alignment

Follow the alignment procedure in the SM-220 owner's manual to adjust the panadaptor. This consists of adjusting 2 potentiometers and 1 trimmer capacitor through holes thoughtfully provided in the side of the cabinet.

The alignment instructions rely on the use of the internal Marker Generator to generate a signal at the center of the passband. If you haven't converted the Marker Generator circuit, you can tune your receiver to a frequency with a signal present at a known frequency (like 162.550 MHz - the National Weather Service), and use that as a frequency standard.

Most of the time spent in aligment will be in alternate adjustments between the trimmer capacitor and the wide band sweep potentiometer, which interact with each other.

Wider Bandwidth

The SCAN WIDTH switch on the stock SM-220 can be set to display a 40 KHz or a 200 KHz wide picture. I adjusted my modified SM-220 to display a 100 KHz or a 500 KHz wide picture. By adjusting the controls on the side of the SM-220, wider bandwidths are possible, but wider bandwidths make it more difficult to resolve individual signals close to each other in frequency. As the bandwidth gets wider, the horizontal sweep loses linearity, causing the graticule calibration lines to be inaccurate.

Connection to R-7000

As mentioned earlier, a DC voltage is present at the R-7000 IF output connector and is used to power an ICOM TV accessory. A direct connection between the R-7000 IF output

connector and SM-220 would damage at least one of these units.

To block the DC voltage, a 0.1 microfarad capacitor was soldered inside the R-7000, between the IF output jack and the adjacent jack labeled "spare". Connection between the

R-7000 and SM-220 is then made using a short length of RG-58/U coaxial cable, with one end plugged into the R-7000 "spare" jack, and the other end plugged into the rear of the SM-220.

This leaves the original IF output jack undisturbed so it can be used with the TV adaptor accessory.

Vertical Sensitivity

When I connected my modified SM-220 to my R7000, the SM-220 would display only the strongest of signals. To improve the display sensitivity, I inserted a 20 dB gain RF amplifier between the R7000 and SM-220. The amplifier was a spare Ameco PLF2 FET receiver preamp, adjusted for 10.7 MHz, but other amplifiers can be used, provided they have at least a 500 KHz bandwidth, and sufficient gain, at 10.7 MHz.

False Readings - Images

The SM-220 circuit is like a superheterodyne receiver. The panadaptor itself has a 455 KHz IF, and like other superheterodyne receivers with a low IF frequency, is prone to images.

An image is manifested as a false pip, which moves across the screen as the receiver is tuned, and is 910 KHz (twice the IF) away from the actual signal.

The images discussed here are in the SM-220, not in the receiver. Images are bothersome on the strongest signals, like those 300 watt paging transmitters that saturate the county with RF, belching out out strange digital noises or voices (now illegal to monitor).

Use With Other Receivers

The modified SM-220 can be used with other receivers having a 10.7 MHz IF. In other receivers, one would need to find the proper point in the IF stage (before filtering takes place), install a connector, then wire a DC blocking capacitor between the IF stage and connector.

WIDER FM FILTER IN THR R-7000

by Barre Ludvigsen

I am trying to replace one of the 10.7mhz IF 150khz FM filters of my ICR-7000 with an XF-107E (40khz) wide crystal filter from Spectrum (the type designator is from memory) for better APT reception.

Right now I am using the 150khz bandwidth which works, but gives me some interference. I have tried to insert the 40khz filter i // with the 150 using a switching circuit similar to those used in the narrow FM filtering schemes, but the new filter seems narrower than 40khz and gives excessive noise.

The reason I want to use a switchable circuit is to retain the 150khz bandwidth for broadcast FM and audio through the radio when using the TVR-7000 unit. I suppose I could for-sake broadcast and take the TV audio out of the TV unit, but switching would be nice.

Memory Scan Using the R-7000 Remote Control

by Johnathan Vail, N1DXG
Tegra-Varityper, Inc., Billerica, MA

Here are the details of a mod I sent to MT a few years ago:

This will change the function of the MS key on the remote control to select SELECTED MEMORY SCAN instead of MODE scan. Why they didn't provide this as a function in the first place seems rather odd.

On the remote control option board inside the R7000, remove the cathode of D40 from the board and bend the diode up

slightly. Attach a small wire, like #30 wire-wrap or some-thing, to the lifted cathode and tack solder it to the cathode of D32.

You could do this with cuts on the board but the tack solder method allows the mod to be backed out easily if needed.

An alternative method is to run the wire from D40 through
the hole where it used to be, and solder to the gray wire
(pin 8) of P1.

I figured this out with a scope and the schematic. The
switches are all polled by the CPU through a diode matrix.
Lots of combinations are possible but I didn't fool around
too much.

I know that this radio is not a scanner, but I want to know if it is capable of being interfaced with a computer. I have a golden opportunity to purchase one relatively cheap (an 800 mhz model)and was wondering about controlling it via my computer. Any other information about this radio would be appreciated also. If it is not inconvenient, please also email me the reply at: webmaster2@audiophile.com

The 456 is a gem. Easy to install (took me 2 hours) and worked
perfectly the first time.ZDoes everything it is advertised to do.
Excellent product.
Radio Manager is fairly easy to use and very good program. ScanStar is
better but very complicated and takes a while to learn. Very
versatile, many features such as spectrum analyzer. Great program.
ScanCat is not so good. My personal opinion- it's junk. Have not tried
ScanWear as the demo times out in 10 minutes and is severely crippled.
It's not worth bothering with.

I would also be interested in a fix if there is one. I will use 3
battery packs if I take the 2500 out for a day of scanning. And, at
that, I'm dead before the evening is through. It was this radio that
convinced me to only buy scanners that used standard nicads and alkaline
batteries. I now travel with a hand full of rechargables instead of
battery packs.

SATELLITE LISTENING POST BULLETIN - Saturday - 1/11/97

CURRENT STATUS - 0037Z (7:37 p.m. eastern time)

Perform inertial measurement unit preflight calibration. Align
Merritt Island Launch Area (MILA) tracking antennas. Perform open
loop test with Eastern Test Range. Conduct gimbal profile checks of
orbital maneuvering system engines.

Name: STS-81
Launch Agency: NASA
Launch Site: Kennedy Space Center, FL, Pad 39B
Launch Azimuth: 42.88 degrees
Launch Time: Sunday, 12 Jan 97, 0927Z
Launch Vehicle: Space Shuttle Atlantis

The 200 nautical mile circular orbit will be included 51.65
degrees from the equator using the direct ascent technique. This
will carry the external tank's impact near -0.3 N. Latitude and
-125.5 deg E.

Space Shuttle Downlink Frequency List

VHF-band 139.208 MHz Shuttle/Mir Docking Operations
UHF-band 240.0 or 242.0 Mhz SRB
UHF-band 243.000 Mhz AM (Emergency Voice Channel)
UHF-band 259.700 Mhz AM (Primary Voice Channel)
UHF-band 279.000 Mhz AM (EVA Voice Channel)
UHF-band 296.800 Mhz AM (Backup Voice Channel)
S-band 2217.500 Mhz (Data)
S-band 2250.000 Mhz (Data)
S-band 2287.500 Mhz (Data)
C-band 5400-5900 Mhz (Data)

I use about 70 feet of RG-8X. It is some kind of new cable that came out awhile ago. I got mine at a CB shop. If I recall correctly, it does everything RG-8 does which is very thick, but is thinner than 58. If I am wrong don't shot me. I got my length for about $30. I highly recommend it.

If you listen to these enough it is not hard to deduce that there are numerous callsigns for a single aircraft.
For example the aircraft might be SENTRY 21 and this call would be used by the flight crew.
The folks in back may be DARKSTAR; with DARKSTAR MIKE being one position (technician for example) and DARKSTAR ECHO being another (maybe a director) etc. etc.
But there ain't no magic secret, they are just AWACS aircraft.
If you get lucky and catch one with radar problems you will frequently catch several of the folks talking to the ground using their own callsigns as they try to fix the problem; and if the flight crew makes the initial contact for the phone patch you can tie the flight callsign to the tactical crew calls.
You are more likely to find this on HF than UHF.

Didn't hear RL, but I'd agree as much as disagree.
Consider that we're asked to believe that it was a scanner enthusiast, in Florida, who just happened to come across this call, *and* have a recorder going at the moment. Really, even when listening was legal, how often would there be anything worth taping if one wasn't looking for something in particular? It's not as though one would want a record to help in writing out a QSL request.

I'd be willing to bet a $1 or 2 that if the truth be known there was probably no scanner and, if there were, *certainly* no recreational scanning involved. One doesn't have to be paranoid to imagine a situation where someone tapes the conversion off a wire, sends it to the press, and trys to pin the blame on a bunch of hobbyists that don't have much political clout.

Does this make me an official conspiracy theorist?

1032. Advice for new guy

Hello,

I am new to this scanner hobby. My boss at work is into it and has gotten me interested in it also. He isn't very much into the technical side of it so he can't help me much with my questions.

I have been looking around the net for answers and have found some pretty good stuff. My main question now is about the type of scanner that might best suite my needs.

I live out in the country, I am 26 miles from Lawton, OK, which is the largest city near me, and 4.5 miles from the city of Fletcher which also has a police force and volunteer fire dept. I would like to be able to monitor stuff in Lawton, but am not sure if I will be able to get reception or not. I can get the TV stations, but they have distortion. FM radio comes in OK here though.

I am interested in a portable scanner that I would also use at home, but don't know if they sacrafice much in the way of distance.

I know where I can get a RS PRO-43 w/cell mod (of course I wouldn't actually LISTEN to it, but it would be there if I visit Canada) for $280 or a BC 220XLT for $170. I realy don't know if these are good prices or not though since they are a few years old and not being made anymore so I can't check new prices.

Also, I have been reading about some new devices for cell traffic and do I even need to worry if a scanner can be modified or not?

Well, anyone that has some advice please email me at catfish@ionet.net

Thanks
Dave

HI I am John from Wis
I have a pro 43 with the cell mod on it and I will never sell it I LOVE
IT, iT IS NICE AND SMALL. I have had it for about 3 years and no
problems with it at all.You puy a Austin Condor on it and you will puck
up 50 to 800 megs no problems at all.

Rick Cooper wrote:
>
I bought mine FROM Radio Shack for $130.00 here in Southern California.
This was only about 3-4 months ago when they were discontinuing this
model. I lucked out... I got the store display which was quite easily
modifiable for CELL Phones. (It was the older model)*. The store display
was very old - even the cig. adaptor was broken off it was so old.
Except for a small scratch on the display, it works great! I modified it
immmediately for CELL. Anyways, now that Im babbling... and getting down
to price. I would personally ask for much more than $150.00 if you plan
on selling it. My boss has already offered me $200.00 for mine, but Im
so happy with my purchase, it would take much more than that to get me
to sell it.

Anyways, look on the back. I think the 2026-A is the model that you want
to try to stay away from if possible. It is the model that cant be
modified for CELL. I dont really know what it say's on the back because
ive never really seen one since mine is the plain ol' 2026.

I also had alot of fun putting in Red and Green LED's for backlight..
then changing to red totaly. It has a very nice effect and is easily
done. The orange is brighter tho.. so expect to lose a little clarity
using red if anyone wants to modify theirs. (Unless you get bright
LED's??)

Dave,

try your earphone jack for audio. If you get audio take radio apart and check speaker connection. also check earphone jack to make sure contacts are together. check for object in earphone jack. if none of this works send to factory for repair. hope this helps somewhat.

1038. Outside Antenna

Newsgroup: rec.radio.scanner

I have a 75 foot outdoor antenna mast that is topped with a normal TV type antenna. It runs coax cable over to the house and down to the living room through the attic. I don't use it much at all since I don't get great reception from it out here and I have a satellite dish.

Is it possible to convert this thing into something that will function as an outdoor scanning antenna?

post comments or email to

Me too. I've not purchased another scanner yet, but vowed to never buy
any electonic device that doesn't accept standard AA, C, D, or 9V
cells. Hope Uniden see's these posts.

>Anyone know what this might have been?

As some others have pointed out, the callsign DARKSTAR is associated with E-3 AWACs. Some other AWACs callsigns which may or may not still be in use are SENTRY (w. two-digits), CHALICE (w. alpha character) and my favorite, DRAGNET (w. alpha character ex: DRAGNET VICTOR).

Someone else pointed out his favorite overall, DOOM, used by Barksdale BUFFs. It's my all-time fav as well.

Yes, I'm seeing more demand for this.
In my area, there is considerable variation in the
modulation among land mobile transmitters.

As a historical note, a solution was provided long ago
by Capri Electronics of Canon, GA, an innovative scanner accessory
manufacturer now out of business.

Capri sold a VE-18 "Volume Equalizer" for $49.50. It required
12VDC at 200 ma and an external speaker. It plugged into the
external speaker jack on your radio. Maybe you can find one at
a hamfest.

Part of the VE-18 catalog description follows:

"Stop fiddling with your radio volume control. Let our
Volume Equalizer even out those volume fluctuations for you.
A change of 25 dB at the input results in only a 5 dB
change at the output."

"Also, noise outside the voice band is filtered out by the 4th order
300 to 3000 Hz bandpass filter to make the audio more understandable
and pleasant to listen to. You set the volume with the volume
control on the VE-18. Ideal for scanners an CBs...."

If you want to build a scanner volume compressor,
consider a small audio compression module advertised in
Nuts N Volts magazine. C & S Electronics (not to be confused
with C & S Sales) makes an inexpensive, low level module
and an amplified module.

I tried an early version of the C&S module a couple of years
ago. I inserted it at the wiper of the volume control in an old
BC300 base scanner and measured the performance.
The early C&S module wasn't quite up to the task, but I don't

recall all the details (perhaps their AGC time constant was
unsuitable).

I provided C&S with my findings and they said they were
developing an improved module. Though I haven't tested it,
the newer version may serve well as a scanner
volume compressor.

For $300, by it. It is a very good reciever. I have had on for a few years now & it is my primary portable. I also own an AOR8000, & Pro-43. I use them all differently. You will find out however, that the 7100 is very sensetive, almost too much for cities. You will have to use the "att" a lot. Don't take the back off, or you will force the microprocessor to reset, loosing all freq's stored. You have 10 banks of 100 memory ch, AM,FM,WFM,LSB, USB modes, & a freq recieve rang 100khz-1.65Ghz with nothing left out. This radio in not type accepted in this country.

I didn't hear Rush, but from what I've read, it sounds like he was doing nothing other than re-reading the AP report.... What I want to know, is WHEN did it become illegal to modify a scanner to receive cellular?

That bit of legal wisdom courtesy of the AP article. The AP article also hinted that ANY receiver capable of receiving cellular was illegal to manufacture... I thought that it had to be capable of scanning before the cell ban covered it.

Was that you Glenn, or perhaps it was Bob Parness (or maybe someone else) who years ago proved to a media type that all you needed to receive cellular calls was a pre-1985 b/w vhf/uhf TV with manual tuning? Seems it's time again for a little show like this... possibly haul the reporter type around to Salvation Army, St Vincent De Paul, and other thrift shops and demonstrate on the sets for sale, just so the reporter doesn't get the idea the set might have been modified for such a demo.

I traded in a version 2.0 for a 3.1 for $175 difference a few months ago. I don't have the full version history, but apparently the new unit is more sensitive and has less internal generated noise.
IMPORTANT-If you plan to reaction tune and AR8000 with the 2.0 you need to buy a CBAR adapter from OPTO for about $50 to generate data that the AR8000 can understand. The 3.1 has this built in.

>
> --

OK, some info from an OPTO junkie:

The Scout is NOT blocked on cell. But since it is a frequency counter,
it really does not have to be blocked by the manufacturer.

If you reaction tune an AR8000 or AR2700 with a Scout, in order for the
radio to actually listen on the cell ranges, the Radios MUST first be
unblocked with a software program (Scancat Gold, Radio Manager, etc)

The XPLORER is cell blocked when shipped to locations in the US but can
be unlocked with a file found in SCANCAT GOLD or with the OPTO supplied
CIV.EXE program and the unlock code printed in a recent issue of
Monitoring Times in the "ASK BOB" column or at this link:

http://phoenix.fullerton.edu/~ddillon/xplorer.html

The R-10 Interceptor is not cell blocked (even the current models!)
Couple that with one of their CF802 amplifier/filters if you desire to
monitor the "Forbidden" band!

Hope this helps - OPTO should give me a discount!

By ELAINE WALKER
Herald Staff Writer

The would-be owner of Hollywood's police radio tower has a penchant
for collecting discarded police radios and communications equipment
that keeps landing him in trouble.

Alan Leonard, a felon out on parole, is being investigated by the FBI
for computer fraud and copyright infringement. That was news to
Hollywood
city officials, who managed Monday to get Leonard to drop any claim to
the police tower.

``The city doesn't want to have anything to do with people like him,''
City Manager Sam Finz said. ``The good news is we're not going to be
Doing business with him anymore.''

According to an affidavit filed Dec. 10 in U.S. District Court in Miami
by FBI Agent Kathleen Antona, investigators believe that Leonard may be
manufacturing and cloning Motorola radios, then selling them as the real
thing.

Reached at his home Monday, Leonard declined to comment. ``I would
really like to talk to my attorney before I go any further.''

The FBI raided Leonard's Miami home and the offices of his business,
Communications Electronics Engineering of Miami, on Dec. 13. A
collection of Motorola radios, computer equipment and diskettes was
seized.

As of Monday, the FBI has not filed any charges against Leonard, and
the investigation remains ongoing, acting spokeswoman Anne
Figueiras said.

``I don't believe we've done anything since the search warrant was executed,'' said Figueiras, who would not discuss the nature of the investigation.

Documents show that the FBI investigation began in January 1996, after a call from Joe Krause, an attorney for Motorola.

Krause told the FBI that he suspected that Leonard was in illegal possession of Motorola software, which he was illegally using to program Motorola radios.

After Krause's complaint, the agent Antona, who specialized in high-technology crime, turned her attention to Leonard's business practices.

Antona's review found probable cause to believe that more than eight times during the last year, Leonard has assembled Motorola radios from used or scrapped Motorola radio parts, federal court documents show.

The FBI claims that he then used a computer and illegally acquired Motorola software to program the radios, which he allegedly sold as genuine Motorola radios, without permission from the company.

``Alan Leonard has willfully and for purposes of commercial advantage and private financial gain embarked on a scheme to defraud Motorola and Motorola's legitimate customers,'' Antona wrote in her request for a search warrant.

Antona also found probable cause to believe that Leonard made unauthorized changes to the radio programming software contained in the Motorola radios.

The changes give Leonard the capability of producing, using and selling radios that can access -- illegally -- the Motorola communication system used by the FBI and other local law enforcement agencies, the affidavit said.

This is not Leonard's first brush with the law.

He was convicted on charges of second-degree murder, conspiracy and attempted robbery with a firearm for participation in the Feb. 17, 1978, attempted robbery at the Round Table Restaurant in Coral Gables. Leonard's two companions in that incident -- one of whom was a police informant -- were killed in a shootout with Coral Gables police.

Leonard's parole officer, Nanette Russell, told the FBI that during the past few years she has received inquiries from at least three South Florida law enforcement agencies about Leonard's business practices.

The inquiries concerned Leonard's allegedly illegal operation of businesses where he sold police equipment, badges and ``police-type'' portable radios.

By comparison, Leonard's controversy in Hollywood is small scale.

Leonard claimed that the police communications tower was part of a collection of surplus communications and radio equipment that he bought from Hollywood in December 1995 for $500.

After vowing last week to fight for the tower, Leonard suddenly backed off at a meeting Monday with city officials. He signed an agreement releasing any claim to the police tower -- or any other towers owned by the city.

Finz said Leonard told city officials Monday in a closed-door meeting that he realized that the police tower was never supposed to be included as part of the surplus equipment.

: Sounds more like Newt was set up by one of his own.

Given how hard it is to intercept a particular cell call with nothing more that a scannner . . . Add to it the coincidence of somone scanning at random and just having to have a recorder running . . . Something doesn't add up. My best guess is that one of the parties is under surveillance or it was a setup. A few possibilities suggest themselves.

It was a cordless and a neighbor, knowing that the owner often discusses sensitive issues in this unsecure fashion, keeps the voice-activated tape recorder constantly.

It was a set up, that is, a cell or cordless may not have been involved. Someone party to the conversation (or tapping the line of one of the participants [these are high powered dudes, so a tap is not as far-fetched as one might think]) tapes the call and sends it off . . . ("Hi, I'm just a concerned citizen . . .")

I wonder what this will do to the price of used 43s?

Of course the Republicans will try to figure out who in the chain they can "get" for this infraction, but I really don't see how they can inflict that much damage as the Democrats deserve.

I might remind the newsgroups that it was a DEMOCRAT congress that hosed us with the E/C.P.A. , and they are the ones who evidently broke it big time.

BUT HERE IS THE POINT I WISH TO MAKE>>>>> We need to keep our eyes open from now on for NEW legislation regarding our scanning rights. Gingrich & co. got a real good lesson on what a saran-wrap-fig-leaf the ECPA is. He probably won't be able to get the folks responsible, so we responsible acting scanner owners are now a target. IF you get a lead on any pending legislation regarding scanners, please post it here ASAP so we can hopefully defeat it.

I'm having trouble envisioning this, Bob.

It doesn't say if he wanted a base antenna or wanted to go mobile. In
the case of mobile I would recommend the Radio Shack Elevated-feed 5/8
over 1/4 wave Cellular antenna. I've used mine for about five years and
it still works like a champ.

As far as base goes, the trick is more to keep the coaxial cable as
short as possible and to use low-loss coax like Belden 9913 - or
better. A discone is a good all round antenna but even the RS antenna
above stuck on a tower will outperform it on 800MHz.

Help!

I've just downloaded the PocSag decoder PD2.03 and am having some problems with it.

I'm using it with the Pervisell "HamComm" decoder and an AR3000.

The software is indicating that it's receiveing data from the decoder (the lindicator next to the date is spinning) and when a message is received it shows the baud rate (1200), but that's it! No actual decodes.

Any suggestions

Also I've read that PD works better when the decoder is connected directly to the FM discriminator outout. Does anybody know where this is on an original AR3000 and if it does make any significant difference?

Thanks

Dave Cripps

I found a neat device at Target for people who don't have a cassette deck in their car. It is a small (1.5"x1.5"x0.5") box that has a mini transmitter in it. You plug this into the cigarette lighter and it also has 2 shorter wires (one for power, one for audio). You plug the 1/8" into the headphone jack of the CD player, or in this case, the scanner, and the power into the power. The device then "broadcasts" the signal from the headphone jack onto the radio by turning the car into an antenna. This device is called the SoundFeeder. It was about $17 at Target about 2 years ago here in St. Louis. I am not sure if it is available anymore, but you can try it. You can make it broadcast on any frequency on your FM radio.

Questions?

: -- Janeane Garafolo.

I tend to agree with the theory that "Darkstar" is an AWACS style
tracking plane. In the April 1995 issue of popular communications they
featured an article about AREA 51, the Groom Dry Lake Test Facility. In
the article they list frequencies in use. Among them was this heading:

Groom Lake AWACS Frequencies ("Darkstar") 376.2, 391.8 MHz

Hope it helps.

Initial feedback I have seen indicates it is a much better
unit than the R-1(better dynamic range, use of AAs and
finally Icom has given us "banks"). However, I have also
heard that it scans EXTREMELY slowly.

I am hoping Mr. Parnass will have a review in an upcoming
Monitoring Times? If not, perhaps he'd care to share his
views with us here?

==========
Keep in mind when converting television antennas for other use that the
UHF
band in TV is pretty broad. <200 up to 800+ MHz. Some of the UHF Only
long boom antennas tend to be cut for better performance at the higher
end where more gain would be helpful. As the UHF Mil A/C freqs are at
the lower end on the range 200 MHz +/-, you might end up with an
OFF-FREQ,
very narrow beamwidth antenna that doesn't serve the purpose you want.

But then antennas are 15% Science and 85% magic!

I too just bought a BC150 and I LOVE IT!!! It's my second scanner and for the price... you just can't beat it. For better range and reception, be sure to replace the antenna. $11 at Radio Shack will get you a three section telescoping antenna for better portable use. A roof mount antenna at home will make a huge difference.

I'm in Northern Illinois if you are near by and want to share good frequencies you find.
ENJOY!!!

After a long study of which interface to buy, I decided the CE-232 was the way to go for me. I ordered one today and can't wait to build it and install in my PRO 2006. I am looking for tips In the event I want to add an Opto board in the future. I will be constructing the CE-232 unit in a project box external to the scanner. My first concern is the DB-25 connector I will be installing on the back of the scanner. I want to make sure the physical location does not interfere with the installation of the Opto board. I have heard of people using both units in one scanner and am anxious to hear your comments. Also I hear some people have to remove the power transformer and use an external power supply to make room for one of the mod's. Can someone clarify this for me?

Thanks in advance,
Tom Greenli

The TV doesn't do anything. The STATION reduces the level on a
commercial.. so there are VCR's that will pause commercials. The TV
notices the lower volume (it's not really noticibaly lower, maybe on a
dB meter type unit) but it is lower, so the TV senses that and
mutes...

> bandwith etc.
> COMMENTS?

The following was posted early/mid December.

The new R10 was first shown here in the UK by Icom during Mid October at the Leicester Rally - the unit has been available in Japan for a short time and also Australia. We have been playing with one for a short time and Icom (UK) have just received there first shipment also.

The set is very compact and pleasantly "simple" in appearance - it is certainly the smalles of the current crop of receivers with such coverage of 500KHz - 1300MHz.

The Two line Matrix LCD display is clear and uncluttered - intensity can be set to four levels. 1000 memory channels are provided (Banks A-P) with 50 channels each - thats 800 channels and Banks Q & R have 100 channels each. The latter two banks are used for Auto Store and also those frequencies you wish to skip when searching - they can be scanned though as "normal banks". Each memory channel stores, frequencies, mode, attenuator setting (on/off), Skip On/Off (lockout).

Upto 10 characters can be used for each channel description. The description allocated is only displayed when the channel is recalled manually - and then for just a few seconds. It does not display the description if that channel is stopped on when scanning (As on the AR8000 & MVT-9000). Each Search Bank can also have a description of upto 10 charcaters.

As with the AR8000 & MVT-9000 the rotary dial is used to select the letter, numbers or characters that can be used however Icom have included a useful shortcut feature in that each of the numerical keys (0-9 & .) equate to 2 letters and one number so that you can jump around the character set a little quicker - pressing the Function key first gives you lower case equivalents.

If you forget the channel number of a specific channel you can do a name Search (assuming you have assigned a Alpha tag) to locate channels begininng with certain letters.

There are 20 search banks with upper/lower limits, mode, step size, attenuator on/off.

Icom have stuck with there Bank, Program or Mode Scan features. Delay is set at 2 seconds (called Pause). Setting Delay at 5 seconds r 10 seconds causes the R10 to continue after set number of seconds regardless of whether the transmission has ended. The Voice Scanning Control (VSC) will try to detect when unmodulated signals are being received when scanning and continue.

Performance wise the sensitivty is good - the Icom specs don't make you jump out your seat but in use its been good accross the band. Poor adjacent channel selectivity with trouble from adjacenet channels was reported by some early users although we have not noticed this - in the Broadcast FM band the R10 is the best when compared to the MVT-9000 and AR8000. Our local FM radio station is 97.50MHz - there is a "not so local" on 96.90MHz - on either the AR8000 or MVT-9000 tuning 96.90 still results in the local station coming over the top - on the R10 there is no sign on 97.50 on 96.90 with two distinct transmissions received.

Quite noticeable when connected to an external antenna here at work was Intermod from pagers - this occured on quite a few VHF airband frequencies programmed in together with the 139MHz area although on an external antenna at home no such signs were present - certainly no IC-R1 though.

Scan speed is slooowww compared to current sets a little over 6 channels per second although search speeds are higher at around 16 per second.

Modes available are WFM, NFM, AM, LSB, USB & CW. There is also an Auto Mode which selects the mode associated with frequency ranges there is also a auto step size - the two do work independantly from each other if you wish. At this stage I don't know if this "bandplan" can be altered by any means (ala AR8000).

Icom have also included a switchable Noise Blanker function for LSB, USB & CW and a Aotomatic Noise Limiter for AM. The bandscope is not a patch on the MVT-9000 although in reality I doubt many users really make use of this feature on any of the sets with it.

Hope that gives some insight at this stage.

Percon is out of date, inaccurate and a copy of the DOC data base in
Canada.

The DOC does not give out emergency services frequencies. Thus non can
be found in the Canadian Version. It is also an old COPY of a DOC
data base from years ago and in my opinion is a great waste of money.

You can get the same information on the internet from the DOC and use
your own data base to look things up.

I bought mine brand new from Radio Shack last May for $150.00. since it has been discontinued and a new model is now on the shelf you shouldn't have to deal with competition form the store so I'd try $150.00, especially if it is one mfg. before cellular restrictions and is modifiable. Mine isn't.

I'm glad you cleared that up! I was following this tread for some time
and I wanted to tell them they were crazy but since I don't own a Scout
I was just waiting in the background for someone else to do it.
I have the CUB and its in no way blocked.....picks up cell phones
great.
I really think that they meant the Xplorer....its blocked from receiving
cell phones.
I would love to have either one of them!

Do you think the LAFD would ever allow one or two dispatch WAVs to be put
on the web site (with addresses partially censored in the style of
"Rescue: 911")? I've wondered what a scanner listener would hear when an
LAFD incident was dispatched, and it seems that little harm could be done
as long as part of the address were removed.

>Therefore, at least one of the Republicans involved in that
>conference call *is* an idiot. The question is: Which one?

The more important question is what, if any, action will be taken against the individual(s) who intercepted and recorded the phone call.

This is the ECPA test case we've been waiting for IF "Butch" Reno decides to pursue it. However, given the fact that this was done against Republicans, the likelihood of her taking action is rather doubtful.

Anyone have any info good or bad about the Optotronics OS456 & OS535 package for the PRO 2006 ? Also which software works best with this set up ? I've heard that Probe is very good but the package that Opto has on sale for 199.$ comes with Radio Manger for Windows and I wouldn't want to spend an additional 100.-200.$ for another software program if the one inncluded in the package is fine. My key needs are auto logging and CTCSS decoding. Any info on this would be appreciated. Thanks.

drice@enuxsa.eas.asu.edu (David Rice) wrote:
>
>Do you think the LAFD would ever allow one or two dispatch WAVs to be
put
>on the web site...

David:

We have been contemplating doing just that since we got the website on-line nearly two years ago.

Actually, we are hoping to develop streaming technology through the City's server to offer real-time dispatch info. A voice synthesized dispatch system scheduled to go on-line in 1991 has been seriously delayed. If that system is (ever?) used, we would simply strip the numerics from the data stream and have "Mr Robovoice" read the time, type, cross streets and assigned companies. "He" would be busy, as we have roughly 800-1000 incidents dispatched each day.

In the meantime...

What we are hoping to do is put up a paragraph or two of text and a couple of photos about truly monumental fires that have occured over the years on the webpage. We would then put a small "dispatch" and then a "size-up" .wav from the first arriving companies (if available). Since I do the website in what little spare time life offers me, it will be awhile coming though.

As you may be aware, the LAFD does not "dispatch" units from quarters over the radio (never have!). We use a hard-wired system with failsafe backups to deliver the audio into the station along with a hard-copy printout and (now) an MDT message. It surprises many monitoring enthusiasts to learn that what they are currently hearing on their scanners is a --simulcast--- of just a portion (that we wish to broadcast) of the full dispatch message spoken into the Fire Stations. All you have is the voice of the Firefighter/Dispatcher rattling off the response info. No tones, warbles or other goofy stuff. We have never used those two-tone sequential alerts (heck, even our friends at L.A. County Fire gave up on those several years ago) or other stuff that folks seem to find interesting. Nope, we're BORING! <yawn>

If you'd like more info about our Dispatch Center, you can visit our website. We also have a full frequency list to make your next trip to Los Angeles more interesting.

Thanks for the suggestion.

The Scout is a freq counter. As such it is capible of recording any freq in it's arange of reception, including 870-895mhz. It the scanner that this freq range is blocked. If you by from outside the country or mod it here you can recieve 870-895mhz. The Scout when connected to the AOR8000 (when fixed-rember it comes broked fron the factory) will here 870-895mhz.

These boards from Opto relly do what the clame. With a program like Scan Star, the will do anything, ie: log freq's, log tones-PL/DPL/DTMF etc, it has a spectrom annaliser, and many many more features. The boards allow Scan Star to take controll of the radio for all functions but you cannot reprogram the Radio Shack radio's with a new set of freq's. You do not loose what you have programed in the radio. You switch from comouter ctl to radio ctl. You can log a days wearth of activity with the computer. Call Grove for order info.

I've got an AOR AR-8000 for sale - $466 plus FedEx COD. The radio is in mint condition, and has all of the original packing materials and manuals. It is the U.K. version, so the bandplan is continuous with no gaps in the cell band. I've also got the following accessories for it: EDCO Computer interface, 4 fresh nicads, and leather case. Thanks for your interest.-

The intercept was a huge topic of conversation on the Rush Limbaugh show on 1/10. It was amusing to listen to the various theories on how this could be done. My guess is the Republican involved was not an "idiot". Sounds more like Newt was set up by one of his own. Let's see if the celluar industry screams for prosecution on this one.

Yeah, I do that, too, in my mobiles where handheld audio is not all that
great and wonderful.

>What I want to know is this.... with todayï¿½s technology, does anyone
>offer a speaker that regulates the volume automatically. This would not
>be unlike some of the televisions that boast about reducing volume
>levels when commercials come on.

Well, it could be done, but I doubt that anyone has done it. There are
possibilities for you to check, though. Grove Enterprises and some other
company make standalone speakers with a lot of frills and options built-in.
I don't know that these offer what you want, though.

>Iï¿½m sure all of you that read this newsgroup are more than aware of the
>changes in volume when scanning. It ranges from a modest level you set
>for the average conversation to an annoyingly loud repetitive bleep or
>continuous screech

Well, yeah, but that is more or less the nature of the beast. Now all
scanner audio sections have a built-in AGC (automatic gain control) and your
external amplified speaker probably does, too. Each AGC works internally to
its own purposes......but obviously, the two do not handshake and work
together. Understandably so.........

>I would pay a premium for this technology if it served my needs
>directly. This would probably be a single mono powered speaker like I
>have....but with this enhancement.

Well, you *could* design and build an external limiter or clamper to
regulate the drive to the amplified speaker. I'm pretty sure nothing of
that nature exists on the shelf, so to speak.

> It might also be in the form of
>software. Perhaps I could ï¿½listenï¿½ through the computer speakers and
>have the volume adjusted via software.

Well, that is a thought, I suppose. Software is pretty specific and not
widely found on the shelves. So you'd have to get "in" with a software
developer who knows sound cards. There are a couple who pop into this
newsgroup from time to time.

> It seems there would be many
>other applications other than scanning the air waves and annoying TV

>commercial volume enhancements.

Maybe......but in my own experience, the loudness of scanner sounds is not much of an issue. I just deal with whatever comes up, I guess. I dunno.... it just never occurred to me there was a problem. Software...I know little about. All I know of programming is that it comes on the radio and TV.

Hardware is my forte' and I know that electronic circuits can be designed to sense some stimulus with a criterion and then provide either a control or a logic signal, based on the parameters of that criterion. One of the primary ingredients, you see, would be what is called a "feedback and control loop". Not all that hairy, but definitely more than a few resistors and diodes.

So in a sense, you're looking at a $200 solution for a $20 speaker, and that's why there's nothing to be found off the shelf. Business doesn't see the percentages in that ratio, if you catch my drift.

I'm not sure there is a viable or practical solution to your dilemma at the present time. It may be one of those things where you have to create the remedy yourself.

Many, yes.....

>WHAT ARE THEY ???

Depends on what you want to do. There isn't a list exactly.

>WHAT ARE THE INSTRUCTIONS ON HOW TO PERFORM THEM?

For the PRO-2021? Now all that much has been written for the PRO-2021, but what there is, usually can be found in scanner modification books, magazine articles, and otherwise in hard copy.

There might be a thing or two for the 2021 posted around the Internet, but it's such an old and out of date scanner that no one is likely to know for sure where. Also, only the simplest of things can be posted into a plain ASCII text file. And most mods require pictures, graphics, and other enhancements that do not fit well in a plain text file.

The PRO-2021 is highly modifiable.....but you won't find a shopping list and storehouse of the information on the dozens of things that are possible. That information more or less exists for other scanners, which you'd have to acquire and evaluate for use in yours.

See my FAQ that was recently posted in this newsgroup. It addresses pretty much your exact questions.

>Thanks, John

That model was one of the best scanners they made. I have one and
it's great, but it's a knock-off of a bc scanner...i think the
760xlt which i have next to the 2026.... i think the price I paid
was 229 or 249.

so anywhere under 175 is a great deal....it's a very sensitive
scanner and gets all bands equally well...not like some of the
newer bc and rs units which get variable receptivity...

150 would be a nice buy
125 would be a fantastic buy
100 would be a fantasy-buy.

>
>Thanks in advance.

We hams generally use a device called a 'TNC'. The one I use is a
baycom clone sold for $30 by the local packet club. There may also
be soundblaster-based software that decodes packet.

As for software, the baycom comes with great software. Normal TNC's
just need a terminal program. There are more specialized programs for
packet on Windows, Linux, etc. Check some of the ham-oriented FTP sites.

And then there's 9600 baud packet. In this area it's used mostly for
links between packet nodes.

I've had WiNRADiO for more than 6 months and I'm verry happy with it.
OK, it's not portable, but if you're seriously into scanning you
can't put a discone antenna into your pocket anyway,
so portability is not really an issue...

Besides, lots of data decoding software is now available using
a sound card, so you need a PC anyway.

It has more features than most scanners.
You can download their software from their webpage
http://www.winradio.com to see how it works.

The preformance is pretty good on VHF/UHF.
If you're very much into shortwaves, you might need a prescaler-
but that's true with most wide-band scanners.

You also get a programmer's developer library with it.
If you're into programming, that's useful.
I am now trying to develop some software for it (in Delphi).
But progress is slow as I only now started programming for
Windows...:-)

Cheers,
Peter

Pat

I have a Pro-46 (11A2). The one modification which works on my unit without having to actually open it up is: Press L/OUT, 2, and 9 at the same time. Then turn on the power and you will be able to access the 800 cell phone range between 868-896 that you normally would not be able to access, along with 66-88MHz. They will appear in your first three banks. (The actual frequency is 888.96 that you can scan up and down) Doing this will totally wipe out your previously saved entries, so be careful.

Hope this helps

Ruben

1166. Problem with DISCONE antenna

Newsgroup: rec.radio.scanner

It's 10 Jan 97 22:03:04,
We'll return to matthew@adelaide.DIALix.oz.au and All's
discussion of Problem with DISCONE antenna

ma> It picks up VERY well on VHF freqs but not very good on UHF freqs.
ma> (around 460mhz) Quite often my rubber ducky antenna is better!

ma> Im using rg58u type coax (about 10 metres) Someone once told me that
^^^^^

This is your problem. This stuff is about as good as wet string at UHF
(except for very short runs). Go out and buy (as a minimum) some 213
coax, or if you can afford it, 9913. :-)

ma> Any ideas? Should I buy new coax?

Definitely. You won't know yourself. :-)

213 should be fine for a strong signal area.

As a case study, I had a friend on UHF CB. He put up an antenna and ran
over 10m of RG-58 coax. His signal into the local repeater (15-20 km
away, and staring him in the face) was barely readable. Yet, when I
pulled up in the car in his driveway, the repeater would peg the needle
on my set. His radio checked out fine (power, etc).

At some stage, he changed to 213 coax, and put one hell of a signal into
that repeater. :)

As I said, spend some money and buy some coax. You won't know it's the
same old discone. :)

1167. IL Scanner Laws (None!)

Newsgroup: rec.radio.scanner
Date: 1997-01-12 00:00:00 UTC
From: n9jig@TheRamp.net
Message-ID: <n9jig-ya023080001201970005130001@news.theramp.net>
Source record: 212028

There had been a request for information about scanner laws in Illinois, but some of the replies got lost by my server. I have recently come across a forward of an erronous reply that said there was a law against scanners in IL.

Here is the real scoop:

Illinois has NO state law prohibiting or restricting scanners or monitoring whatsoever.

The City of Chicago has a law that outlaws the use of a scanner during the commission of a crime, but makes no other restrictions.

A couple of years ago, both the State Legislature and the Chicago City Council tried to outlaw or restrict scanners, but due to the actions of CARMA, RCMA, and SABRE members and others, the State passed no law, and the City of Chicago passed a very sensible law that protects the rights of law abiding scanner listeners.

In the midwest, IN, MN, KY, and MI have restrictions or permit requests, but NOT Illinois!

There are at least a couple of factors to consider, but the key issue is the software that you are using to run the interface and scanner. I use Probe to run a 2042/535 and the com port is set at 19200 baud; in addition, the software vendor suggests using a low "settling time" of 14-16 milliseconds. With this setup, I often get up to 85 cps scanning speed. I also found that scanning speed increased dramatically when I went from a 386 to a Pentium 100. Buyer beware: The vendor claims are even higher, but in my experience, I have not been able to achieve the same levels. The other issue is whether your software is able to exploit "pipeline tuning" which supposedly eliminates the the serial interface transit time from inhibiting the scanning speed. Evidently (no independent confirmation from me) not all software programs designed for the Opto interfaces will do that...

> Once this is resolved, I'll send in my $40 since it is easy to use.
> I am generally happy with the Opto board, except that it will not
access
> the

> manage
> them on computer,
> -Jim

Yes, you cannot program the scanner directly. If you are running it off the PC, however, there really is no need to do so. You can set up an unlimited number of channels and banks, depending on the software that you use.

From: bmm1@fn3.freenet.tlh.fl.us
Message-ID: <5bbov2$40i@fn3.freenet.tlh.fl.us>
Source record: 212033

I was listening to the frequencies below .55 MHz the
other night and there are about 20 repeating morse
code call signs between .2 and .5 MHz. I assume they
beacons. When I looked up the allocations of the call
signs it appears that they are coming from all over
the world i.e. YMN is allocated to Turkey BRA is allocated
to China JAV is allocated to Japan etc. Does anyone know
why these exist? Does anyone know of a complete list of
them? Also there are some oddly modulated signals between
.15 and .2 MHz. They sound something like LORAN. Does
anyone know what these are?

Thanks
Bruce

from Aimnet Information Services thoughtfully posted:

> I have just moved to pacifica,ca and would like to have the
> police frequencies to monitor the krooks and there locations. I
> could go buy a scanner book from radio shack, but I hate going
> there. Please help.
>

Hi Greg & Sue,

Don't bother with Radio Shacks book. Get the "Bay Area Frequency
Directory" from Scanners Unlimited in San Carlos (near 92 & 101
on the bay side). Much more accurate and up-to-date, and neatly
organized by county and city.

The basic freqs are:

PD 488.7375
PD2 488.8625 "Tac 2"
FD 154.445
FD W1 154.280 "White"
FD W2 154.265 "White 2"
FD W3 154.295 "White 3"

Some areas around you are the jurisdiction of the Sheriffs
Department, CHP or California Department of Forestry.

SM Co. Sheriff

488.9875 Primary
488.8875 "Green"

CDF

151.37

CHP

42.44/76 (San Francisco div - "32")
42.08/28 (Redwood City div - "91")
154.905 (mobile repeater)

Also visit the Percon site

http://www.perconcorp.com/db_srch.htm

and search for surrounding cities like Broadmor, Colma, and Half Moon Bay (both "PP" and "PF").

Also peek at:

http://w5gb.nmsu.edu/kc5kto/
http://www.best.com/~herndon/scan/scaninfo.html
http://www.smrn.com/smcpsc/
http://www.smrn.com/smcpsc/tech.html

BTW; Half Moon Bay FD is now on 153.890 (shared with "south county fire" ~ Redwood City, Belmont, San Carlos and Woodside)).

All the police channels are in the 488-489 band, and are all on repeaters. The "TAC" channels and Sheriffs channels are repeated county wide. The FD's are a mix of repeater and simplex (it varies city to city).

Have fun!

[snip headers of forged post]

You're absolutely right. I apologize for flying off the handle, but I failed to review the headers in the original post (mea culpa). I guess whoever did this figured Bill would get some angry responses from alt.aol-sucks (we are pretty sensitive over here, and tend to fire from the hip before checking to see if it's the Sherriff or some idiot we're shooting at).

This was just someone trying to get Bill Cheek (of whom I've never heard, but I'm sure he's a great guy, if he pissed somebody off to this extent :)) into some modicum of a flame fest.

Over and done. Back to our respective areas of interest. (Once again I learn to "check the headers".)

Dave,
You should have no problem at all hearing your local
PD & FD using the stock antenna that comes with radios
these days. For the more distant signals, you'll want to
get, at a minimum, an extendable whip or large coiled
rubber duck. The best for you would be an externally

mounted antenna connect with good co-ax to your scanner.
As for the price of the Pro-43 you mentioned, it was
a little high. And the BC220 is still sold these days
as the BC230(its the BC220 with an extra ni-cad). New
price for the BC230 runs $220 and up. Some places still
have BC220 stock which they are trying to clear out for
$200. Also keep in mind that the 43 is a triple-conversion
unit while the 220 is double. Since you live out in the
country a double-conversion unit will be fine. The 43
also covers the UHF military range(225-400MHz) while the
220 doesn't.
As for monitoring cell traffic, that's a personal
decision. I personally don't see what the big deal is
about...doesn't do anything for me. Some people really
seem to get off on it and some like having a radio that
can receive these ranges just to spite Uncle Sam!
Good luck with your purchase and let us know if we
can be of further help!

The backlight in the PRO-2005 and PRO-2006 is implemented with EL-501,
an electroluminescent panel (RS part #10800050), which grows dim
with use. Last I checked, a new EL panel can be ordered through
your local Radio Shack store and sent to your home for about $12
plus shipping.

I've the replaced the backlight, an operation which requires care and
patience. The service manual has an exploded parts diagram which
is helpful in showing how to disassemble the scanner.

>
> --

Hi Roland,

Police Call is basically just "dumps" of FCC data. It lists
some channel usages, maps (very few), basic radio codes (no local),
thousands of important business (not orginized by region), federal
and military licenses (not many), radio bands, frequency
characteristics, frequency spacing and several frequency allocation
Charts (which is nice).

Scanner Master exlains how local and regional radio systems work,
list codes, jargon, PL tones, unit numbering plans, extact
channel usages, stations ID's and thousands of important business,
federal and military licenses, maps and etc.

The Scanner Master Full-Size Guides sell for $29.95 at EEB.

Virginia/Metro DC -3rd ed.
Florida
Illinois
New York Metro/N. Jersey - 5th
Massachusetts Guide - 5th ed.

The Scanner Master Pocket Guides sell of $13.95 at EEB.

Greater Philadelphia/So. Jersey - 2nd
New York Metro/North Jersey
Ohio
Connecticut
Massachusetts & Rhode Island - 5th
Maine, New Hampshire & VT

Police Call sell of $12.95 at Radio Shack and EEB

PC1=CT, ME, MA, NH, NY, RI, VT
PC2=DE, MD, NJ, PA

PC3=MI, OH
PC4=IL, IN, KY, WI
PC5=IA, KS, MN, MO, NE, ND, SD
PC6=DC, FL, GA, NC, SC, VA, WVA
PC7=AL, AR, LA, MS, OK, TN, TX
PC8=AZ, CO, ID, MT, MN, NV, UT, WY
PC9=CA, OR, WA

For Washington DC area, I prefer "The Washington-Baltimore Scanner Almanac" by Willar Hardman, Phd & Alan Henney. It's just as good or better than Scanner Master and sells of $19.95 at EEB.

I think you'll find that most Scanner heads will purchase both Police Call and Scanner Master. The more information that's available, the better.

Bob

Hi Bob,

EEB sells the following volumes of Scanner Master:

The Scanner Master Full-Size Guides sell for $29.95 at EEB.

Virginia/Metro DC -3rd ed.
Florida
Illinois
New York Metro/N. Jersey - 5th
Massachusetts Guide - 5th ed.

The Scanner Master Pocket Guides sell of $13.95 at EEB.

Greater Philadelphia/So. Jersey - 2nd
New York Metro/North Jersey
Ohio
Connecticut
Massachusetts & Rhode Island - 5th
Maine, New Hampshire & VT

The EEB Web page can be found at the following URL:

http://www.access.net/~eeb/eeb.html

You can you send an e-mail to ScanMaster@aol.com to see if
a Nevada edition is in the works.

You might have to lock out the station several times, because the
Xplorer will sometimes receive the same station on different frequencies
with slight variation. The FM filter is a good idea, but sometimes will
not work in strong signal areas.

> Radio Manager is fairly easy to use and very good program.

Anyone figure how to get more than 20 channels per second
with either an Opto 456 or 535? I just installed it a few weeks ago, and
am
happy otherwise. I'd be happy to get the 40-50 ch/sec that the scanner
itself
is capable of, at the speed setting of '55' I only get 18 or so ch/sec
during search.
Once this is resolved, I'll send in my $40 since it is easy to use.
I am generally happy with the Opto board, except that it will not access
the
internal scanner memory. Would be nice to upload the 1,000 channels and
manage
them on computer,
-Jim

>> WHEN did it become illegal to modify a scanner to receive cellular?

When I heard Rush he was explaining how police scanners are use
to listen to police and fire calls and that NOW... some scanners
can pick up cellular phones... but that it is not common.

>>
>> That bit of legal wisdom courtesy of the AP article. The AP article
>> also hinted that ANY receiver capable of receiving cellular was illegal
>> to manufacture... I thought that it had to be capable of scanning before
>> the cell ban covered it.

Any manfacutured after a certain date... The real illegalness is
in intending to pick up the phone calls... the equipment is
easily available, legally (specially cell phone interception
systems, where you put in a phone number is probably a different
matter... see: http://pages.ripco.com:8080/~glr/harris.html)

>>
>> Was that you Glenn, or perhaps it was Bob Parness (or maybe someone else)
>> who years ago proved to a media type that all you needed to receive cellular

You are exactly right, this is an impedance problem. Radio Shack sells
a cable with 1/8" mono connectors on both ends and a special type of
resistance wire (I think). This corrected the same problem for me.

You were only hearing the headset from the employees. To hear both sides try listening to 35.020 MHz. That is the frequency most commonly paired with the 154.600 headset.

From the OFFICIAL BNN REPORTS GUIDELINES:

ATT = Attached

Meaning two or more dwellings that are connected together by their
construction design... You find these types of structures in many old
cities. (ie: Row houses, brownstones,etc...) even in the suburbs you
could have attached townhouses.

I hope this helps.... BNN520

1214. RF Fingerprinting

Newsgroup: rec.radio.scanner
Date: 1997-01-12 00:00:00 UTC
From: cwagar@mindspring.com
Message-ID: <32d92c69.3895080@news.mindspring.com>
Source record: 212110

I was reading more about the Gingrich cellular call today in the Atlanta paper and it mentioned that Airtouch here in Atlanta uses 'RF Fingerprinting' and that BellSouth Mobility was to soon implement the same thing.

As a matter of chance, we got my wife's phone bill last week (cloned) and in talking with the Loss Prevention department she mentioned that 'the new clone fighter system' was going online in a week or two.

I assume the two are one and the same. Anyone have any additional info about 'RF Fingerprinting'. I remember a few years ago ads for a repeater controller that fought kerchunkers with an RF fingerprint... Basically matched a known pattern with the one your unit made at keyup. All transmitters emit a somewhat unique keyup as the PLL locks.

Any clues??

-Clayton

1215. interested in scanner purchase

Newsgroup: rec.radio.scanner
Date: 1997-01-12 00:00:00 UTC
From: Tom <radioscanner@geocities.com>
Message-ID: <32D8D6A6.7292@geocities.com>
Source record: 212111

I have given up on the Motorola Spectra I was going to purchase. I am now looking into scanners that Radio Shack has. I am looking for something that will pick up 800, UHF, VHF-Hi, VHF-Lo, weather. I am especially looking at the PRO-29 and the PRO-66. Can anyone tell me the main difference between the two besides the PRO-66 carrying the VHF-Air. I see that the PRO-29 looks much more syphistocated. I am not really worried about how complicated it is to use because I understand things pretty well. If I do something about 3 times with instructions, I can do it without after that. How good are the rubber duck antennas that are on these? I live in South St. Louis City, MO. I especially want to pick up FIRE, EMS, and Police. I do have others I want to pick up if I can, but they are two numerous to list! I have a list of about 1650 frequencies to try. Also, what is the difference between double and tripple conversion? I also (I am getting all this from the RS catalog!) see a NiCd battery pack (#23-288) on page 43 of the 1997 catalog. It says that it is "For many Radio Shack Handheld Scaners." Is this the NiCd battery you put in the handhelds that say "uses 4 AA Alkaline or rechargable batteries?"

Thanks in advance,

Tom Skillman

> It's not worth bothering with.

I concur. I use the OS535, and like it very much. I just installed
Radio Manager and have been putting it through its paces, and I
really like it so far. My only two minor complaints are that the
scan speed could be improved, and it doesn't work under Windows
NT (it crashes after a few minutes). ScanStar is also very nice.
ScanCat Gold for Windows is garbage. It's very buggy, too many
bugs to mention here. The audio is choppy, when you try to use the
lockout feature, it locks everything out, etc. After a couple of
e-mail replies, they now no longer even respond, so I would say
the support is nil as well.

Well I think you may have something there. While listening to the Cell
freq. I would have had a problem getting a recorder hooked up in time to
get anything of intrest. This sounds to me like some profesional was
stand by ready to record anything that was going to be said on that
phone, but they found that they could blame the hobbyists and get away
with it. RS and all the other blowhards will milk this for all it's worth.
I think the New York paper that published the story should be
blamed for printing the story. The Meida is always getting the Cart before
the horse. Look what happened with the Dallas Cowboys players.

>That's kind of upsetting to scanner people.. Geez, if LA wanted, they
>could never give a location over the air!

It's better than what they do in Seattle! All you hear in Seattle is the companies to respond, the channel, SOMETIMES the call type (aid, medic, or fire), and the cross streets. No exact address is given, and the exact nature of the call is not given. Sometimes you get "aid", "fire" (could be a car fire, could be a 6 alarm high-rise fire), or "medic", but the other times you just have to guess based on the channel number.

As if it couldn't get any worse, you only get THAT info if one of the units is out of quarters. If all the units are in quarters, you hear absolutely NOTHING.

Phoenix (where I live) uses MDT's to transmit additional information, but the exact nature of the call (MVA, shooting, house fire, etc.) is usually given. Sometimes they use "generic" call types like "ill person" or "assist PD", presumably for the purpose of privacy.

A few times I have heard dispatches along the lines of "Engine 16, Battalion 1, check your MDT for a dispatch", but those are rare.

The "quick and dirty" method is to pick up a used, center loaded CB
antenna, remove the antenna from it's base, and remount to the
top-center of the discone by whatever means necessary.

Mark

The truth as I perceive it to be.
Your perception will be different.

>
The US VHF marine band is similar with few problems developing so far
even though the unlicensed recreational boaters use the same
equipment, power and antennas.

I only hear commercial GMRS users in my area on one repeater. I
rarely hear a personal GMRS user licensed or not.

You need to have an FM trap on the antenna input. The Xplorer is a near field reciever that is different to use than a scanner.The FM trap blocks out 108mhz-118mhz. A friend has one (I would, but don't have the $1000 or so it takes) and that is what he does. Don't get frustrated. Use it as it was inteded to be used, as a test & measurment insterment. You could also lock out all the FM signals you get.

I tried this program (and a few of it's older versions) and nothing
ever appears on the screen. I have a Compaq with sound, a PRO2042 and
I connect the tape out to the mic in on. I can hear the tones, I can
see the volume bar, but nothing ever gets decoded. Any thoughts?

ddd3@atl.mindspring.com wrote:

Here's what I have now into my roof mounted scanner antenna:

I used a 10' section of 1 1/4 galvanized railing from section of
chain link fence (that I removed when I installed a large gate for
boat to pass through fence in back yard) for mast. Radio Shack
sells #15-843 painted one (looks to rust over time) for $13.
The base for mast was old caster wheel fork with wheel removed.
I drilled a hole 2" from bottom of mast about 5/16" in diameter
(same diameter as wheel shaft) and attached mast to mount so that
it pivots. Radio Shack sells similar mount # 15-888 for $5.
Antenna # 20-176 was $18. I just bought Radio Shack's
$35 antenna # 20-014 today which someone told me was much better
than the one for $18. I plan on returning the other one soon. This new
one is 6' tall and has 3 horizonal rods 6' in length (which makes this
antenna 13' in diameter!) . I put the vertical part together in my
bedroom but will have to finish assembly of horizanal rods on roof.
I used a $3 Radio Shack 100' guy wire # 15-031 (cut into 3 pieces each 33')
and a guy wire ring # 15-835 ($2). Also I bought Radio Shack 40' ground wire
15-035 for $4 and grounded wire to existing phone ground rod located by
outside phone box. Antenna mast was mounted on very center of
house 2" from peak so that mounting bracket is off of peak of roof.
Once screwed into roof, mast is then pivoted upright. I attached guy
wires to gutter nails which hold gutters in place. The setup is very
sturdy, and is easy to lower for repair or adjustment. You only have to
disconect one guy wire to lower mast. I used 50' of R59 # 278-971 coax cable
assembly with PL-259 connectors on each end and cut one end off to feed
wire through hole drilled in wall and reattached scanner end of wire with #
278-234 right angle BNC connector.However, I plan to try using RG-6U coax
with F connectors and BNC adapter (RS # 278-251) on one end,
F connector and 259 adapter (RS # 278-258) on antenna end.
I heard the RG-59 coax was a bad choice, and I have plenty of extra
RG-6U cable from satellite dish installation. The only other thing you
might need is about 6 or so 8" plastic wire ties to secure coax to mast,
and mabe some sealant (like silicone caucking) at coax to antenna
conection. I can't wait to get new antenna and cable up.

If you use similar hardware here's the line-up:
all Radio Shack parts...
antenna # 20-014 $35
10' mast # 15-843 $13
mast mount # 15-888 $5
100' guy wire # 15-031 $3

guy wire ring # 15-835 $2
40' ground wire # 15-035 $4
BNC adapter # 278-251 $3
PL-259 adapter # 278-258 $3
50' RG-6U coax cable #15-1548 $15
---
total: $83 + tax

Bill,

What frequencies does your 9000 cover? has it been modified at all?
How many channels? Is it a base or mobile?

These might be ignorant questions, but I have no idea what model that is/.

thanx,

I have V-tech Tropez 902- a 2 line with digital. I like it, i do however pick up some distortion, when whoever im talking to doesn't talk loud enough. I called the company, and they thought it was because the signal is converted into 0 & 1's digitally. FOr the most part its good, and knowing that no one can listen in is especially comforting.--for the time being anyway!!!!

That was one of the many problems with the early 2500's and was a defect. I sent mine back to Uniden and they fixed it and gave me a free battery pack. Under normal conditions the battery should stay charged with radio off. Mine in my 3000 lasts 6-8 hours on full charge running.

1253. STS-81(Atlantis) Shuttle Frequencies???

Just noticed that the Space Shuttle Atlantis is supposed to be taking off at 3:37am (cst) this morning and was looking for any frequencies available that would allow a little bit of "listening in" in the Chicago area. I've started looking thru the Shuttle Mission web site (http://shuttle.nasa.gov/) as a start. They have RealAudio of mission control (but it hasn't taken off yet!), plus many interesting links.....got to go and look some more....

Thanks in advance,
Al

The Message-ID also indicates that it originates at Zippo. Also it was posted using Forte Agent ver. .99e/32.227. The only version of Agent that I have known Bill to use is .99d/32.182 and that wasn't recently. I believe the forgery to be the work of one of the resident marsupials in rec.radio.scanner. My best guess would be the one whose name rhymes with BATS.

As Brett said, it is NOT illegal to have a scanner in your car, ham or not.

It IS illegal to use the scanner for purposes to further a crime. That could be construed as accessories and/or parties to a crime.

Thanks to Ted and Kim Moran, honchos of CARMA, the initial law NEVER PASSED! It could have slipped thru, but was caught before its ugly head went very far in the legislature!

The F-117 was tested and flown for years basically right out in the open,
using a A-7 transponder and a A-7 callsign, so when they called into the
tower, they would come up as a A-7 on the scope.

The radio transmissions that were intercepted by a hobbist in Amarillo
Texas were on 260.8 and 364.2, NORAD channels. A E-3 from Tinker AFB was
using the callsign "Dragnet 51" and two unknown aircraft were using the
callsigns "Darkstar November" and "Darkstar Mike" and transmissions
constisted mostly of phonetical alphanumerics. There was also encrypted
transmissions on 288mhz. Just after these radio transmissions, the photos
of the "Donuts on a rope" contrail were taken. The article was in the May
11, 1992 AvWeek.

Uh, Oh...Don't tell them that! Or they will make it "illegal" to
tune any "pre-`85" set above channel 69!

Has anyone checked into seeing if he was using a *digital* (TDMA)
cell phone at the time???

Those are a *little* harder to receive with a scanner. ;^)

On most NNTP servers, posts have a line -- "NNTP-Posting-Host:" -- that
indicate the IP address that originated the message. (For example, in
your post, I can see you posted from shb.vnet.net; here,I posted from
some dialup at Mindspring.) With that single line, it's fairly easy to
refer complaints of harassing posts -- or spam -- to the originating
ISP.

Both Altopia and Zippo news servers, OTOH, do NOT provide the NNTP-P-H:,
so another layer (the NNTP server provider) must get involved in
tracking harassing posts/spam, az they are the only ones that can
determine where a post originated. (For this reason, certain of tese
"alternate" NNTP servers are havens for warez traders, etc.) AFAIK,
Airnews *does* provide NNTP-P-H: lines.

>net. In this case, the guys at zippo can provide info on the ISP that the post
>came from, and that ISP can identify the login id. The header indicates super

Unfortunately, this time *they* have to do it. Normally, *anyone*
seeing a post could do so.

I built the circuit that comes with PD and although the bar was spinning it wasn't decoding, I found a mistake I had made in construction, repaired the mistake and it sprung into life so maybe it's the decoder. I works perfectly using the audio out of my Yupiteru 7000.

That is because most Democrats are hypocritical "ends justify the means" types. You don't see any of them on the hill, especially Dave "Big Mouth" Bonior, criticizing the selling of our Government by the White House sleazeballs. Let us take time just prior to the January 20 coronation to remember some of the highlights of the last four years:

1. Travel office firings including abuse of the FBI's investigative powers
2. Abuse of FBI files
3. Drug dealers at the White House for dinner
4. Whitewater billing records that mysteriously appear
5. Large political contributions by foreign interests with possible connections to the Communist Chinese
6. Beijing's top arms dealer visits Clinton in the White House
7. Possible obstruction of justice by tampering with a crime scene (Vince Foster's Office) during the Vince Foster investigation (Aren't all suicides treated as murders until a suicide can be confirmed)
8. The infamous haircut on the runway at LAX (I know it may seem petty but it shows just what a bunch of elitist morons these people are)
9. Illegal aliens voting and mass naturalizations of new citizens prior to FBI background checks to determine whether they have criminal histories (The FBI reported that up to 100,000 of such citizens have criminal backgrounds and in the past would not have been granted citizenship)
10. Multiple cabinet secretaries under investigation (Brown, O'Leary, Cisneros)

When it comes to ethical or criminal misdeeds Newt Gingrich is a rank amateur in comparison to the professional racketeers just down Pennsylvania Avenue.

I am trying to find out how to modify my BC200XLT so I can use an external speaker through the earphone. As I understand it, there is a limiter in the circuit designed to prevent people from blowing their ears out when using the included earplug. This is all well and good, except when I want to use it with an external clip on lapel speaker.

Is this something I could do myself, or would I be better off having a shop do it? Any details, etc., would be appreciated.

Pat,
I've had a Pro-46 for about a year now. I'm very happy with it. I clearly receive just about anything I tune to, and it programs very easy . I like the size and durability. I up graded the antenna and seemed to help. It doesn't receive in the 1300 range, but picks up 30mhz - 956.000mhz. I live on a hill above SF Airport (about 10 miles out)and pick up ALL air traffic. Even CHP (Calif Highway Patrol) using their VLF are clear from duplex both dispatch and mobiles from San Francisco (Golden Gate) central. During the recent storms and floods, I could quickly and easily tune up the utility companies to keep track of the area around me.

I recommend the radio, however, I'm couldn't tell you how much to pay.

The OS535 will, with the proper software, decode DTMF tones. The
OS456 is also advertised as doing the same.

Use a speaker that has an amp in it. Usualy 12v. power supply is needed.
Radio Shack sells two that would work,(1) in the car amp. speeker around
$20 workes real well, (2) they have one that is 9v bat.opp. the sound is
not as good but it works, (1) is your best bet.

Does anyone have any mods for the Uniden BC 2500 XLT?

Nothing special in mind, just wanted something to "spice up" the rig. With all it's power problems it was a disaster from the start.

Do you know of any scanners better than better in monitoring the 800 freqs that are trunked?

Please EMail if it's not too much trouble.

Thanks,

Levi

repost:

From: russell@cbnewsd.cb.att.com (russell.w.keating)
Newsgroups: alt.radio.scanner
Subject: 2500xlt cellular mod
Message-ID: <CButu9.EDs@cbnewsd.cb.att.com>
Date: 16 Aug 93 13:37:19 GMT
Distribution: usa
Organization: AT&T
Lines: 65

NOTE: since receiving this mod, I have been told that there are two
different pc board designs for the 2500xlt. Make sure you have the
unit that corresponds to this mod.

This is the cellular restoration mod for the Bearcat 2500xlt. The
paper this was taken from had no Copyright notice on it so here it is.
The diagrams included on the paper make things much easier to
understand.

1. Remove the antenna and battery pack from the BC2500XLT. Lay it on
its face on a soft cloth or towel, bottom of the radio facing you.
Remove the two upper (black) and two lower (chrome) screws.

2. Carefully pry the back loose from the radio and lift it off.
Similarly, grasp the visible circuit board by the edges and carefully
pull it away fron the radio just far enough to separate it from the
white (11 pin) Molex connector. Do not stretch the remaining ribbon
connector. Lay the board alongside the radio.

3. Locate microprocessor chip "Uniden UC-1513A", and the cluster of
chip resistors marked "104" below it (see diagram). Using a
magnifier and fine-point soldering iron, unsolder the
lower-left-most chip resistor and move it one place to the
left, soldering it in place.

Reassemble the radio by reversing steps 1 and 2, and test it by
entering 879.990Mhz. Search steps in this range will be the
correct 30 KHz.

|Make identification by resistor matrix.|
p = solder pad
c = a component
R = the resistor to move
X = the new location
for "104" p | p-c-p p | p-c-p |
p X p-R-p p p-c-p p-c-p p
^ ^
| |move this resistor "104" to the
left
| |

Ron Katz <ron.katz@canrem.com> wrote:
>Does anyone know if the New bearcat BC2500 can be
>modified to recieve in the Cellular phone band???
>
>Do you know and can you tell me what the MOD involves?

I have never tried this mod. I have one page which I received from
Grove
about this modification for cellular restoration.

The page notes that the modification may not be really necessary, because
you can still hear the cellular communications in the image frequencies
21.6 MHz higher that the true cellular ranges. Thus, you will hear cellular
calls in the 894.01 to 915.60 MHz range on your BC2500XLT without
modification.

If you really want to do the modification, here are the step-by-step
directions. Most of what follows is copied verbatim from the Grove
sheet, which does not have a copyright notice on it. Therefore, I'm
assuming it's OK.

1. Remove the antenna and battery pack from the BC2500XLT. Lay it on its
face on a soft cloth or towel, bottom of the radio facing you. Remove
the two upper (black) and two lower (chrome) screws.

2. Carefully pry the back loose from the radio and lift it off. Similarly,
grasp the visible circuit board by the edges and carefully pull it away
from the radio just far enough to separate it from the white (11 pin)
Molex connector. Do not stretch the remaining ribbon connector.
Lay the board alongside the radio.

3. Locate microprocessor chip "UNIDEN UC-1513A", the speaker, and the
battery terminals. Below the microprocessor and above the speaker
and battery terminals, locate the cluster of chip resistors marked "104".
Using a magnifier and fine-point soldering iron, unsolder the lower-left-
most chip resistor and move it one place to the left, soldering it
in place.

Cellular restoration is now complete. Reassemble the radio by reversing
steps 1 and 2, and test it by entering 879.990 MHz. Search steps in this
range will be the correct 30 kHz.

As I said, I have not tried this modification, so I can't testify to whether
it really works. Grove states that Grove Enterprises assumes no responsibility
for damages or other liability resulting from attempting to duplicate this
procedure. It is possible (probable?) that this modification may void your
warranty.

Also keep in mind that there are at least two versions of the
BC2500XLT.
I don't know whether these modification applies to all versions.

Finally, the obligatory note to remind you that monitoring mobile
telephone
conversations, including cellular, is against federal law.

Source record: 212193

I can't say much about the Canadian version, but in the US I have found
that the Percon database is as up to date as can be expected. Our city
recently converted to 800 Mhz.
The very next release of the Percon CD (Summer 1996) contained the new
frequencies.
From what I understand, the CD is compiled from the latest FCC information.
As far as the
search on the Percon web page it states: "Note: Online data is as of June
95. The CDROM
uses current data."

If you run a piece of tin foil so it touches the base of the BNC
antenna AND the earphone plug (shorting it, so to speak), this
increases the volume on any speaker or earphone..

Eric Plent <eplent@injersey.com> wrote:

I saw here a long time ago a mod for the 2026 that helped the squelch tail you get when it gets cold , you set the squelch it opens then never closes it hangs open and the colder it gets the wider the setting to close it , as much as 45 degrees of control position.

I don't know of any mods for the '60 yet; that doesn't mean there aren't
any out there, though.

I did get the service manual, so maybe there will be some soon! :)

It cost $13.97, plus $2.00 shipping ordered from my local RS in NJ.
The manual was shipped directly to my home; I didn't have to go back
to RS to pick it up.

I use the Radio Shack discone (but I had to screw a 49 inch vertical element to the top of it to improve the low band VHF and the 150) . It's still not hot. The vertical element probably changes the resistance.

I found both of these on Grove's website. I was surprised at the price for the RS PRO-26. The 1997 RS catalog has the same radio for $100 more! (it's $349.99 at Grove, $449.99 at RS!).

Any opinions on either of these two would be greatly appreciated.

Daniel Lebreton wrote:
>
> I heard somewhere that a normal television can
> be used to receive cellular transmissions. Is
> this true? If so, how is it done?
> THANKYOU

Yes, it's true! You'll need an older TV set with an
analog type channel selector that can get channels
79 thru 83. The newer TV sets only go up to
channel 69 on the UHF band.

However, you'll hear more than one convestation at
a time, because each channel covers a 6 Mhz spread.

UHF TV Channel frequecies:

72 - 823.750 Cell phones
73 - 829.750 " "
74 - 835.750 " "
75 - 841.750 " "
76 - 847.750 " "

79 - 865.750 Cell sites
80 - 871.750 " "
81 - 877.750 " "
82 - 883.750 " "
83 - 889.750 " "

Please note that it is illegal to monitor Cell Phone
conversation!

Bob

There are several scanners, both handheld and table top, that can receive the military UHF aero band. Some of the manufacturers and some model numbers of such radios:

1) Radio Shack- Pro 26, Pro-60 (I have the Pro-60.)
2) AOR - AOR 8000, AOR 5000, AOR 1000 (old model; I have the 1000 also.)
3) Bearcat - BC-3000 ??
4) Yupiteru - MVT 7100, MVT 7200 (These are very hard to find in the United States. I think they are available in Canada, but have the US cellular band blocked. Unblocked versions available in Japan and England.)

There could be others. Hope this is of some value to you.

Message-ID: <dpm3.1357.00409323@seanet.com>
Source record: 212215

I'm just getting started in ACARS monitoring and have acquired the Lowe Airmaster V 3.0 software/demodulator setup, including docs. The AEA version no longer seemed to be availalbe from retail outlets as AEA went belly up within the past few months. I understand that the manula or docs that came with the AEA version was very complete and a bit (quite a bit?) more helpful than the rather skimpy info that came with the Airmaster. Can anyone provide me a copy of the AEA manual. I would pay for photcopying and postage. Any help would be most appreciated.

An interesting aside in this regard is that the mayor of St. Louis and a number of his cronies were recently embarassed when it was discovered that they were all making calls of a HIGHLY personal nature over the cities cell phone patch. The TV stations and newspaper pushed the story hard and forced the release of a good deal of the info. You might check the Post Dispatch web page and search for info. They got caught in highly compromising situations and at last reprot were all squirming and making some pretty flimsy excuses. This is the kind of thing that might cost Bosley the election this spring!

d>Phoenix (where I live) uses MDT's to transmit additional information,
d>but the exact nature of the call (MVA, shooting, house fire, etc.) is
d>usually given. Sometimes they use "generic" call types like "ill
d>person" or "assist PD", presumably for the purpose of privacy.

d>A few times I have heard dispatches along the lines of "Engine 16,
d>Battalion 1, check your MDT for a dispatch", but those are rare.

Boston PD is starting, or actually, part way through going to mostly MDT dispatch. However, hot calls are put out over the voice channels so that everyone in the district knows something is going on and where. Last night I heard the dispatcher advising units to be sure to log on their MDTs and to send arrived on scene, on site, and MV stops via MDT and to repeat it via voice, so that everyone knows where you are in case you need help. This has cut down on a lot of routine voice traffic, but it makes it a lot more interesting to listen since what goes out via voice is much more likely to be a hot call. Boston FD and Boston EMS are not currently using MDTs although both have the capability since they share the dispatch computer system. Boston EMS has GPS/AVL units with data capability installed in the ambulances, but the system isn't turned on and hasn't been enabled yet.

I don't know if RF fingerprinting can be that accurate. PLL lockups can change depending on the temperature of the transmitter, perhaps even the condition of the batteries, and the aging of the parts inside. It might not be easy to clone an RF "fingerprint" but it may not be all that stable or unique, either. If they do use it, I'll be interested to note how many users get dropped due to false rejects.

The one thing I did not like about the last Tropez 900 mhz phone I
owned was that the number keys are flush. My number 4 wore out and
had to press real hard to get 4 to work.
I bought a Sony ID910 with caller ID and a dot matrix display. the
numbers are not recessed and are easily depressed. Battery last
twice as long as the one that was in the Tropez, plus a battery can
be added to the base of the Sony to keep your phone powerd for 5 hours
during outage !!
I know this does not belong here. The original message was here so I
responed. I got error on a email reply. Whaaaa

123.100 MHz is supposed to be a nationwide search & rescue air frequency. I've been listening to some puzzling transmissions for the past hour now. It seems that an airplane or a few airplanes are "chasing" another airplane or airplanes but the "chaser" airplanes are much too slow to catch their target(s). I've heard transmissions like "restricted area," "Should we switch to GOLD?," "VFR clearance," "Their groundspeed is xxx.," and "We can't turn right at that speed." Anybody know what's going on here?

Regards,
Will

Did anyone see the interview/press conference with the couple that taped
the call? WHAT A SHOW!!!!

These "BOOBS" came off as Ward and June Cleaver!! What a surprise that
they
both active in the Democratic party!! Their Lawyer said that he has had
no indication that the state or Feds will prosecute them. WHY!!

The guy said he bought his scanner at Radio Shack in Sept(I suppose of
1996).
Well, that scanner shouldn't get cellular. He say's he had NO mods to
it.

Then they say, "We just did what we thought was right." BULLSHIT!!
They are FELONS!! Along with the politician that sent the tape
transcripts to the
newspaper!IMHO

I suggest that ALL of you find out when C-SPAN rebroadcast the interview
and watch it!!

Erin

> _)) /
> (_/
To receive packet you would need a terminal node controller [tnc] I have seen them for about $50. I think baycom makes 1 that is a multi mode unit also powered by the computer's power. I believe that the baycom unit comes with software or at the very least you can order software from the same place.

For Packet any terminal software should work fine. Most amateur packet radio work is done at 1200 baud [mighty slow and mighty boring I might add]. When compared to the speed of the internet, well... there is no comparison.

You will be able to receive the packets but obviously not send due to you having only a scanner and probably not having an amateur license. Most packet activity is centered around the 145.mhz area. ex: 144.99 145.01 145.03 145.05

Hope this helps you out. The American Radio Relay League has books on Packet Radio ops. Bye...

Jonster.

You are probably listening to a re broadcast of the shuttle coms by a local or nearby Amateur Radio Group. They also are re transmitted in real time on the hf amateur radio bands. Look around between 144.000fm and 148.000fm and somewhere
[I am on the road & don't have the freq with me] between 7.015 to 7.30 Single Side Band mode.

What you are hearing is not the actual shuttle. I believe the shuttles freqs are located in the mid 200mhz range and you'd need beam antennas and az el rotors to point them .. plus software to track it [?]. Laaa ter!

> FCFM

Kirk,

I use the CE-232 with a 486-50 computer and love it. I belive the big advantage over the Opto is the auto-programing feature of the CE-232. I believe both products are good but not the same type. I know a few people who use both. The CE-232 is fast takes little room on the computer is runs under any operating system. When I first started using it I ran it on a second hand 286 with a 40 meg hard drive. I think upgraded for speed and multi-tasking reasons to a 486-50 with 16 megs and have not looked back. I believe the price is right and tech support is great! Any other questions please let me know. I once again have not used the Opto but do know a few who like it, but it can't auto-program. Which is a really nice feature.

One thing I do with my cE-232 is back up the frequencies in my scanner. Included is a programing script language. Included are scripts to read the frequencies from the scanner and save them to a log file. Then after a mod and I happen to loose my memory in the scanner, I can reload them in about 4 mintutes. Plus I have had the logger on for days with no glitches.

I am using a PRO-2006

Any questions?

Tom,

I removed my transformer this past weekend. It took me about 30
minutes. I purchased the
power supply from Radio Shack with the cat number of 276-1653B. About
21 dollars here in
California. I have also included the Data Tone SQ mod from Scanner Mod
Book 3 by Bill Cheek.
Took me about 4 hours. It might take a normal person about an hour to
do but I haven't used
a solder iron in a while so I built two. I also used the wrong hook up
wire.

I do have a question for everyone else. I am using RG-58A cable. Good
Bad.

Joseph

I saw an ad in Popular Communications (Feb 97) for Cellular Security Group that says they can unlock full 800 Mhz on several scanners, including the 3000XLT. I just ordered a BC3000XLT (haven't gotten it yet) so I called and they say they can do it for $99 (includes return shipping and insurance). I haven't really looked extensively, but others I called said they could not modify the 3000XLT.

If you are interested, the phone number for Cellular Security Group is (508) 281-8892. If anyone knows of other companies that will do this cheaper, I would be interested in hearing from you.

Gene

> do to fix it so I can understand the conversation?
> Thanks
> chris

You heard a scrambled phone. It uses something called frequency inversion. Totally sucks. If you have a scanner with single sideband and a notch filter to notch out the annoying sidetone then you can hear the conversation easily. Without the notch filter you still hear the conv. but there is a slight whistle there.

What can you do to fix it? It is illegal to listen to it or non encrypted telephone coms, young man! But Ramsey sells a kit... don't know if it works and I dont care!

Digitally scrambled phones like the one I use are usually in the 900mhz range and sound like louder static! Ha... Love the darned thing. Tuned it in on my R700 and couldn't make out a blessed syllable... You cannot even tell it is a voice and no fading as you walk thru out the house... Hope this helps...

If you live in Massachusetts, you can join the localized
mailing lists I've created. Both lists have gray areas around
them, so we do discuss areas outside of the primary regions.

(These lists are meant as regional alternatives to the)
("scan-l" mailing list which is nationwide.)

scan-mass-east

This list covers all of Eastern Mass from West of Worcester
to the East right into the water.

To subscribe to this list, send a message like this:
To: scan-mass-east-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-east-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests go out Monday and Thursday mornings.

- -

scan-mass-west

This list covers all of Western Mass from East of Worcester
to the West.

To subscribe to this list, send a message like this:
To: scan-mass-west-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe

The list is available in digested form too. It's address is:
To: scan-mass-west-digest-request@nomad.n-reading.ma.us
Subject: subscribe
[Message Body] subscribe
Digests go out Monday and Thursday mornings.

- -

If you have direct WWW access, you can get on (or off) of the
lists via the simple interface at:
http://www.netspace.org/cgi-bin/lwgate/nest/

http://www.netspace.org/cgi-bin/lwgate/scan-mass-east/
http://www.netspace.org/cgi-bin/lwgate/scan-mass-west/
or for the digested versions:

I know that mobile scanning is illegal in Florida. If you have a ham license, are you totally exempt from this law?

One end was in DC. Where was the other end? If it was in the town
where the scanners or tappers were, then it's plausible.

> are not. Take it to alt.politics, please.

You might not like the partisan emphasis of the post but it is valid to discuss the political issue in this newsgroup because...

The ECPA was written and enacted by POLITICIANS.

This "violation" of the ECPA was alledgedly commited by politicians (indirectly or directly).

It will be interesting to see how or if the law is or is not applied in this case. Will the Justice Department pursue those that illegally taped a conversation? Will the taped conversation be used by either side of a debate on ethics?

Cellphone monitoring laws have been a legitimate topic of discussion in this newsgroup. Now there is a case that makes us stand up and take notice - lets see if this ECPA is "unenforceable" as some like to claim. It happens to involve politicians - that just makes it more entertaining.

Regards

> Thanks

First off, all scanners sold in the US after, I think, 4/1/94 (or somewhere around that date) must have the cellular band blocked, as it has been "illegal" to listen to the cellular band since that date. In addition, those radios can not have the cellular band "restored" or "reactivated." Does this mean that you are out of luck? Of course NOT. There are at least two ways to get around the "can't-listen-to-cellular-law":

1) The easiest, and most beneficial to your wallet: buy a *used* scanner that was sold before the no-cellular law went into effect. I, along with thousands of others, have such a scanner. I think most of the major scanner manufactuerers made cellular-capable scanners at one time. AOR, Radio Shack, and Bearcat come to mind. You'll probably get a few "for sale" offers over the Internet. Good luck.

2) While this is an expensive way to go, you could also buy a new "unblocked" scanner from Japan or Europe. A Japanese company, Yupiteru, makes a *killer* handheld scanner called the MVT 7200. It can do almost anything you'd ever need a scanner to do for you. The only problem is that this model costs around $700 or so. :-(On, yeah, US Customs might pose a slight problem, but I haven't read any posts to that effect. Seeing that you have a relatively small budget to work with, option #1, above, seems to be your best bet.

Hope you find something you like and is within your budget. Happy scanning!

Some couple, politically active, snagged the transmission from
an old scanner, and it was apparently not going over a split
transceiver. They gave it to the 'critter.

Janet Reno prosecute her buddies?!? She & her gang don't press
even minor civil and criminal matters against her friends.
That'd be as unlikely as Congress appointing a special prosecutor
to press the murder charges to which she has publicly confessed.
They only call it the Department of Justice; that's not what it
actually does.

For the full spectrum listener, or for SCPC, this compact scanner is hard to beat:

tuning range from 100 kHz--1856 MHz (Unblocked from the factory for full Cellular coverage!)with direct keypad entry or knob tuning, 100 channel memory, switchable preamp and attenuator, programmable 24-hour clock timer, 10 search ranges, LCD bargraph S meter, AM and wide/narrow FM mode detection (no SSB) just begin the list of features. Comes with VHF/UHF telescoping antenna, HF wire antenna, AC power cable, box and manual.

Sells for $680.00 new. This monitor is in excellent condition, and can be yours for only $475.00 E-MAIL TODAY FOR MORE INFORMATION!

From: GAMassey@Avana.net
Message-ID: <853194710.17110@dejanews.com>
Source record: 211921

I have a question, is it possible to pick up both sides of a cell phone conversation on the same frequency. Or does the cell phone transmit on one frequency and receive on another freq.

If two frequencies are used, then how in the world would someone just happen to hear (and record) both sides of the conversation ?

Also, how close to the the cell phone does the scanner need to be to pick up the signal. From the length of the transcript it appears the recorded conversation lasted at least 15 minutes or more. It seems the cell phone would of traveled out of the range of the scanner in that length of time.

It just seems to me that someone must of been in a van full of equipment following the cell phone they wished to record. And if that is true then this looks like the work of a professional, not a retired couple in Fla.

If anyone can answer these questions I would sure appreciate your help.

Thanks in advance.

I just finished fixing my XLT200. It had these very symptoms (no audio, no dial lamp, but keypad and LCD working OK) and it turned out that Bob Parnass' tip had the right cause (open Q201 plus shorted C36). In my case, C55 was also shorted. Note that C55 is the same type of cap as C36. Uniden must have bought a bad lot of these electrolytics back in '88, or else they're underspecified at 10V. I replaced them with 35V. caps.

It hasn't shipped yet, when I last checked. (I am working on the new 15th edition of the Radio Netherlands -- http://www.rnw.nl -- Receiver Shopping List.) Price is estimated at US$500, CAN$900. You can get a photo and spec data off the ICOM America Web site at <http://www.icomamerica.com/icom/>. Look under new products, as I recall.

I'm looking for an affordable handheld scanner that picks up celluar and all of the other features or can be changed with a special crystal. Im hoping not to spend too much money on it if possible. I was recommended Radio Shack and someone else said the BC3000XLT but that is a little expensive. Please email me back with suggestions.
Thanks

I bought a device like this, made for the U.S. Army, which does exactly what is described in Bret's posting. The device has a seismic probe that you stick in the ground. You set the sensitivity of the seismic probe with a switch. You unfold the metal tape antenna and install 2 9V batteries. The device emits a series of audible beeps on a VHF frequency (I forget the exact one) when the device is activated. Several of these devices came in a set, each device used a different series of coded beeps. Each device is in a very attractive olive drab, water-tight case. At Dayton several years ago, I belive I paid around $10.

The device is called a "personnel seismic intrusion device." I don't remember the AN/... military part number. I believe that they are available from Fair Radio sales. I occasionally see them at hamfests.

San Jose PD uses it with a different PL as their backup channel. You can hear it pretty good with an antenna in S.F. SF uses it as a repeater, only about half the time. It's PIC-9 with the repeater and PIC-10 without. Sometimes guys one guy will be on the machine while the rest are simplex, probably in error.

Bundy, were you the one at SRL on Main during the Crimewave?

The Europeans use the longwave band for broadcasting, spaced 9 kHz apart, starting at 153 kHz. The easiest to hear broadcasters are Algeria (1000 kw) on 153 and France (2000 kw) on 162 kHz. These two stations are the indicators on reception conditions; I can usually hear them every night, obviously best during the Winter months, from an hour before sunset here to an hour after sunrise at the transmitter site. Check out any recent edition of the World Radio TV Handbook for details.

Hi, sure the BC860 can be modified for Cell-band reception. Along with
simple 'ol image reception which works but has inherent drawbacks with
frequency steps and lack of complete coverage. The best way to do
Cellular with an '860 or other similar scanner that has a 10.8 MHz IF is
through the Virtual Downconverter mod, available from Cellular
Security(508-281-8892). With this you will have complete cell-band
coverage, nice 30 KHz tuning steps, and the exact same receive
sensitivity as you would have on other 800 MHz frequencies. With the
'860 you can also search-lockout those nasty data channels too.. BTW the
Radio Shack PRO-2040 is basically the same radio as is the BC860 have
fun and don't listen to anything that I might,,,, DE WA1YKL

I have a schematic for a seismic intrusion sensor in our technical library at www.wenzel.com. The sensor is made from two round Radio Shack magnets and a molded inductor. The output is a timed pulse which could be used to power a low-power transmitter.

From: randy.bowman@pcohio.com
Message-ID: <24.32473.3897@pcohio.com>
Source record: 211946

To All,

I recently got into monitoring when I decided to get a shortwave radio to listen to Russian broadcasts. Unfortunately I don't think I made a very informed purchase.

Now that I am in the market for a scanner I'd like to get some input before I make any purchases. With that, I see alot of advertisements for the Radio Shack PRO-26. Any comments on this unit. Any better buys out there for the same price range?

Also, I saw some advertisements in "Monitoring Times" by a firm in England that were offering "unblocked" PRO-26's which can receive cellular frequencies. I've seen on some of the posts in this group that it is illegal to monitor these frequenceis. Is it also illegal to have a unit which is capable of receiving these frequencies. Even with the full coverage the units from the UK were much cheaper than what Radio Shack is offering them at.

Thanks for any input.

Then stop cross-posting yourself. After all, what's so fucking
interesting about scanning in the UK, anyway? I mean, when you limies
overhear bonnie Prince Charlie saying, "oooh Squidgie, I'd love to be
your underwear," it makes headlines in your newspapers (we call them
tabloids) for weeks on end. You brits need to (1) get a life, and (2)
realize that the British Empire is, and has been, dead and buried for a
long time, not necessarily in that order. You people are becoming as
pretentious as the French... (ouch!)

I've both used and owned a lot of scanners. My absolute favorite is my Pro 2006--an early 1990 model that is fully mod'able. I would never part with it, but from time to time you might find one for sale; expect to pay a premium though. I also have a Pro-51 handheld that has been excellent (and it's even mod'able from the keypad itself). Also hard to find but worth the effort...

Good luck,
Slothrop

Was there anything in the article that said what cellular system he was
using? I cannot believe that a top American politician is still using an
analogue cellphone. If he was using analogue, the twit deserves all he gets.

If it was a digital system, it means the American police have routine access
to digital cellphone decryption equipment.

>the counsel for ethics committe, but was not satisfied with Cole's inaction.

McDermott is a semi-local (he's from Seattle, I'm in Tacoma) Congressman.
He is widely recognized as being unashamedly and agressively partisan and
easily capable of "lapses" of standards to accomplish what he and his
political allies regard as legitimate ends. Embarssing the Speaker Of The
House certainly qualifies. His district is often referred to as The people's
Democratic Republic Of Seattle and the politics of his electorate is located
somehwere to the left of Deng Xiaoping and olnly slightly to the right of Kim
Jong IL. It is rumored that if McDermott should chose not to run he would
likely designate Fidel Castro as his heir apparent ... and the local citizens
would likely elect him!

When studying law enforcement we were told 3 things needed to be present
for an
act to be a crime.

1. A culpable mental state.
purposely
b.Knowingly
c.Recklessly
d.negligently

2. The act must be on the books.
3. A penalty must be listed for committing the act.

I could be wrong, this was Ohio I was studying in, and it's been a few
years.

But it seems to me that a crime has been committed!

1. they were negligent of the law.
2. The ECPA is on the books
3. Is there a punishment on the books for going against the ECPA?

San Diego went from the Gamewell system to a hard-wire system in 1971,
backed up with teletype via the same hard-wire system. That lasted
only a few years as PacBell's bills kept getting larger and larger.

SDFD went to radio dispatch with teleprinter backup, and continued
with the same system when it moved from VHF to 800MHz.

I saw a Uniden cordless phone with a button labeled "scramble" on the handset. I know it doesn't just change channels because there is also a button that does that. Anyway, the question is does the phone encrypt or scramble the radio signal between the handset and base to make it invulnerable to scanners?

Short of the expensive world class receivers, scanners do not come with
S-meters. It's fairly easy to retrofit one to many scanners, and possible
for many others.

I posted a "How to" article on that subject to this newsgroup a week or so
ago.

The maximum length of RG-58 for scanners is about 12 inches. Ok, you can
push that to maybe 10-ft....but that's it. Losses are too great to go any
longer.

>
> I'd like to see that!!!
>
> Regards Phil
>
> phildo@bit.bit.au

Hmm ...

Basic ISW structure: 16 address bits and 5 'status' bits (disregarding
bit interleaving, error det and corr. coding, etc)

Overall transmitted bits: 78 total (includes info and 'parity' bits)
plus
6 sync bits.

EDAC: Block code encoder (45,28) foreshortened to (38,21) code,
convolutional code encoder (2,1) 'rate 1/2' plus 1 flush-out bit then
interleave. Oh - did I forget to mention the "Modulo 2 Add Auto-sync
sequence to 38 bit outer code"?

'A piece of cake'.

Jim

Tom: There are several options to the changes in volume you describe. I have seen commercial units, advertised in Nuts and Volts
magazine, which maintain a fixed volume level with variable audio input. That is to say, if I understand you correctly, that the volume
varies from agency to agency. The leveler that you talk of takes the output of an agency that is very loud and provides a fixed
output. The same unit will also take another agency that has very low audio output, and amplify it to the same fixed level that you
control.

There are also several home-brew projects that do the same. If you can't find one, e-mail and I'll see what I can come up with for
you.

The Bearcat 100xlt can be tricked into displaying 800 mhz, however to convert to 800 would be a major operation, not usually worth
the effort. The radio has no 800 receiver board, and the vco board is differs slightly from the 200xlt. While these boards can be
added, but the time you found them, replaced them, and then added the additional IC and parts for 200 channels (ais is the
BC200xlt), it would be price prohibitive.

Just a quick idea,
Try using thick ethernet co-ax for feeder cable. It's only 1/3 the cost of
9913, with better high frequency characteristics. (Using thin ethernet
cable instead of RG58U cable also works well - same cost savings for 6dB
less loss at 1000 MHz!)
BTW - use crimp type connectors rather than solder type, as the heat from
the soldering iron damages the foam dielectric and aviod walking over or
crimping the cable - that will ruin it!
Also, you may wish to make up a collet to slip over the braid, as both
ethernet cables are thinner than the RF equivalents.
This trick has worked well up in Queensland in a number of UHF repeaters
set up by my radio club.

>Help!

>I've just downloaded the PocSag decoder PD2.03 and am having
>some problems with it.

Hello David

There's nowt wrong with the pd203. The problem will more than likely extend from one of two things

1) poor quality audio being fed into the interface (Distorted)
2) the audio level incorrect.

Both these can be inter-related.

I have done a mod for the "standard circuit" that is on the net that has improved matters no end. The inteface is a schmidt trigger that tries to restore the square wave shape to the audio. It in effect, is a signal conditioner.

One quick instant tip is: When setting the audio level, start with virtually nil audio. Increase very, very SLOWLY until the spinner JUST starts to spin. The best chances of decode is with minimum audio that will get the spinner going. If you increase too much, you will cause two things to happen. (A) overload the schmidt trigger and bring up the additional distortions in the wave form near the zero crossover point - this will introduce false mark/spaces. (B) Introduce harmonic distortion from the audio amplifier from the radio - this will have a similar effect to (A) and compound the situation.

WHATEVER - the audio setting is hyper-critical!

>Also I've read that PD works better when the decoder is connected
>directly to the FM discriminator outout. Does anybody know where
>this is on an original AR3000 and if it does make any significant
>difference?

It will make the world of difference. If at all possible, always take the data audio direct from the discriminator output. (The audio amplifiers in the radio filter or tailor the audio for sinewave not square wave.) The rise and fall time in the radio audio amp is just not fast enough to keep the squareness!

As a precaution I suggest dc isolation should be used - solder a 0.1 capacitor to the discriminator output and take the audio feed from that.

The published schmidt trigger circuit is FAR to insensitive (deaf),
even if taking the audio from the earpiece/extension socket. In my
lab, I noticed it needed 3 - 4 volts p-p audio to get it triggering!

For a earpiece/speaker extension teh trigger level (threshold) i would
tent to use would be approx 1v p-p audio - this puts less strain on
the audio amp and is probably giving cleaner, less distorted audio

For a discriminator output, it essential to provide some form of audio
level adjustment - my mod does that. It also increases the trigger
sensitivity to about 0.5 to 1 v p-p

View the circuit in a fixed pitch font:-

Basically, remove R3 which is a 10k resistor and substitute it with
two resisters in series. One being a fixed value about 560 ohms and
the other being a preset/variable of 470 ohms.

```
|\
| \
0.1 uF | \
---||----|------------------|- \
| |741 \
| | /-----|-------->
\ R1 |-----|+ / |
/ 100K | | / |
\ | | / |
/ | |/ |
| | |
| |---/\/\/\-------|
| | R2 100K
| |
| \
GND /
\ R3 (was 10K)
/ Now should be about 560R
|
|
\
----/---| R4 (additional resistor added)
\ 470R preset.
/
|
|
GND
```

Adjust R4 fro best decode. Better than 90% can be expected if taken
from a discriminator point!

There are indeed beacons broadcasting in the .2 to .5mhz range. They are non-precision aircraft directional signals refered to by pilots as ADF's. All ADF's id in CW and are published on air navigational charts. Many are still in use, especially at small airports. They are used for good-weather (VFR) navigation, and instrument (IFR) non-precision navigation and approaches, although the minimums for such approaches are much higher than for precision approaches such as localizer, VOR, etc. The ADF receiver in a plane is coupled to a compass on the instrument panel which always points to the transmitter. The ADF receiver in an airplane is also useful for listening to the AM broadcast band. If a pilot knows where a radio station's tower is (it may be many miles from the studio), AM broadcast signals can be used as navigational beacons.

No shooting, then, but the truth is that RG-8x is as old as the hills. It
isn't as good as RG-8, so since RG-8 is not a good choice for scanners,
RG-8x is even worse, though it may be a little better than RG-58. CB shops
are famous for reinventing the wheel every few years, and for perpetrating
some of the most goshawful fiction imagineable.

Body handling: HTML body converted to readable text

I bet a lot of you are wondering just how to get your scanner to get along with your tape recorder. I had this same trouble when I bought my 2005 about three or four years ago. I sat down with both manuals, the one for the tape recorder, and the one for my voice - activated tape recorder.

the scanner`s recording jack was putting out about 100 Millivolts of audio , while the tape recorder only required about 20 MICROVOLTS to activate it. That is quite a large difference ! Needless to say, whenever I plugged the tape recorder into the back of the scanner, if I put it into voice - a ctivate mode, the reels would turn all the time anyway, since there was enough audio coming from the scanner even when it was squelched to activate the recorder.
And when the scanner would un-squelch , the audio from it was so loud that all I would get on the tape was noise !

Here is what I did to solve the problem. It is a well - known fact that any voltage will divide across resistors in series according to the magnitude of each resistor. I decided to take advantage of this fact. So, I took two resistors and hooked them in series, like this:

```
---\/\/\/\/\---o---\/\/\/\/\---
R1 - 100K R2 - 1K
```

Now, if I were to hook this arrangment up across the scanner`s output, we would get the following:

Voltage across R1 = 99 Millivolts
Voltage across R2 = 1 Millivolt

here is how we would go about hooking this up to the scanner and recorder:

```
|| | braid
lead | | from
from | | recorder
recorder | |
```

I mounted the reistors on a small perf - board I had. The actual level applied to the tape recorder can be adjusted by adjusting the value of R2 slightly. My particular case needed a 220 OHM for R2, which came out just right ! You can make R2 easier and quicker to adjust if you use a 1K trim-pot
However, your particular recorder might need more audio than that. It is possible to just use about a 5K trim - pot for R2 to begin with. Then , you can just adjust it for your recorder`s audio needs. This has worked REALLY WELL for me for quite a while.

The last I remember, the Michigan scanner/radar detector laws were overturned
as illeagel. They were re-written to state that "if you were using them while in
the commision of a crime .... then they were illeagel for you to have in your car
(In other words you can have your radar detector, but if you are caught speeding
(a crime) then the posession of the radar detector in the car is another crime, I
would assume the same goes for scanners)

If some one knows any different than the above please post it, I don't live in
Michigan, but like to have the information for when I travel.

Is there a computer program or anything that can understand transmittions picked up on a scanner (using soundblaster or something) and tell you what they say? Not just pager transmitions, but lots of places use "coded" transmitions like the hospitals and everything. It'd be nice to figure out what they're saying... if anyone has any ideas, e-mail me: kayvon@hotmail.com

Thanx in advance!

For around $200 you can get a Uniden Sportcat SC150 or
Bearcat BC220/230. There might be some Radio Shack
models that fit your needs but they tend to be marked
up higher in price than the equivalent Uniden models
unless you catch them on sale.

If you have to have one that is modifiable, you're
pretty much looking to buy an older used model since
the new ones aren't easily modified.

Since I probably work/live very close to you, feel
free to e-mail me at wellsr@ibm.net (do not reply
to this note - I'm at work) and we can talk further.

Strong signals,

CH USE FREQ NOTES
---
01 MCSO Dispatch 460.475 -- Primary dispatch channel
02 MCSO Admin 460.400 -- Non-dispatch/civil bureau
03 Ch 2 - Car/Car 460.400 -- Repeater talkaround
04 Tac3 - Car/Car 460.375 -- Repeater talkaround
05 Tac2 - Car/Car 460.250 -- Repeater talkaround
06 Towns East 460.175 -- Little use
07 Towns West 460.300 -- Brockport PD
08 Irondequiot PD 460.075 -- Also dispatch for Webster PD
09 Brighton PD 460.225 -- Also dispatch for Fairport PD
10 Greece PD 460.350 -- Also dispatch for Gates PD
11 Gates PD 460.425 -- Simulcasting Ch 10
12 Roch PD Ch 1 460.025 -- RPD east of the Genesee River
13 Roch PD Ch 2 460.125 -- RPD west of the River/Downtown
14 Tac1 460.325 -- Data/Admin for RPD
15 Tac2 460.250 -- West side of county
16 Tac3 460.375 -- East side of county

Bear in mind, that this is the channelization plan of the Monroe County Sheriff's Office. Greece PD Ch 2 is just a talkaround on 460.350. Ogden PD Ch 4 is 453.250 (Ogden public works repeater). RPD has its own channelization plan, as do most of the town PD's.

MCSO covers the following towns:
Hamlin, Clarkson, Sweden, Riga, Churchville, Chili, Parma, Henrietta, Rush, Penfield, Pittsford, Honeoye Falls, Mendon and Perinton. MCSO Ch 1 is used for Brockport PD from 12:00 am - 8:00 am.

Most data (warrants, registrations, license checks, etc...) are handled over a county-wide MDT system used by all police agencies now on a trunked system around 851 MHz. Brockport PD may also utilize SUNY Brockport's dispatcher for data and mutual aid with the campus police on their repeater (453.350).

County to County mutual aid is carried out over the intersystem (aka "the point) on 155.370.

Hope this helps.

The Tampa Tribune ran a story today which can be viewed online at:

http://www.tampatrib.com/story1fr.htm

The story features yours truly as a dispondent scannerist about to lose his hobby in the wake of the technological upgrade of the county communications system. I am very happy about this piece, because so many other counties have "gone trunked" without any scrutiny of the public benefits which will be lost without some compensatory operation put in place (such as internet casting, or cablecasting the basic patrol frequencies of police).

Also, true to the piece, I'm conducting my activism online. If you wish to be a part of my mailing list on this issue, please let me know at dpinero@pobox.com. My objective is to educate my local agencies, as well as serve as a reference point for media interests. I'm putting a page up in March which will aggressively tackle this entire issue. Your comments are not only welcome, but important.

If you're in the USA, the only legal way to intercept paging is to either be employed as a technician by a paging service provider or to be a law enforcement officer with a warrant. If you fall into either of those categories, you should already know where to get the equipment you need.

There has been a lot of attention paid to ECPA as it relates to cellular phones. Most people are completely unaware of all the other things it prohibits monitoring (like pagers, satellite downlinks, broadcast remotes, etc.).

Any "Scanner" manufactured after a certain date. The article stated
any "receiver". The definition of a "scanner" in that section of
law makes a distinct difference between a receiver not capable of
scanning, and one which is capable of scanning.

It is not illegal, AFAIK, unless they added a new law, to manufacture
a non-scanning receiver capable of receiving the cellular frequencies.

>The cheap analog tuners, not the ones with clicks seemed to be
>capable. Some require a video signal to demodulate the audio,

The ones with clicks work fine too. You just need to use the fine tuning
control, which isn't that fine... it covers up to two channels on each side.

CTCSS has nothing to do with encryption. It is used to reduce
co-channel interference among unrelated users of the same frequency.
241.8 Hz is one of the subaudible tones used for this. Each tone has
an alphanumeric designation.

Bill, You say that RG-8 is not good for scanners, yet you recommend
RG-6. The loss for RG-6 is 2.2 dB @ 100 Mhz, and 4.4 dB @ 400 Mhz,
but the loss for RG-8 is 1.9 dB @ 100 Mhz and 4.1 dB @ 400Mhz. The
RG-6 is half the dia. of RG-8 and half the price, which is an
advantage, but as far as loss RG-8 is better. I got these figures
from the Radio Shack catalog. On another note in reinventing the
wheel Radio Shack sells RG-8/M and RG-8U as the same wire, is it
really. I went there to buy RG-8/M, but the wire I got was RG-8U.
The catalog number for the 8U was the same as the 8M.

My first scanner was a Teaberry 8 channel crystal scanner. I had susequent regency, radio shack and even a couple of sears scanners. I actually thought that the flashing led's were cool. I am happy with the technology put forth in my pro 34, 43, 2011, 2016's, 2006 and 2026. I enjoy my Icom R-100 and even my AR8K. But now for nostalgia reasons, I would like to have another crystal scanner or two, just for old times sake. Does anyone have any old crystal scanners (in working condition, please) that they would like to part with for a reasonable price?

If so, please drop me an e-mail: anonid@alt.net

Couple of things are possible: First: You may have a case of IMD.
Second, it may be the Coast Guard or one of the other miliary branches
doing target practice.

I often hear other "target" aircraft calling approach in the
Washington DC area with weird military callsigns while I'm flying
around. Pilots often use any frequency they can find which is clear
for air-to-air. 122.75 is supposed to be used for this purpose, but
there are many aircraft on that channel. Some folks use 123.45. This
is unofficial. Some holler at each other on 122.9 (yechh, everyone
and his uncle is on that one). So I can see some frustrated folks
decide to use the SAR frequency. It ain't right, but who's gonna
complain?

First, understand that CTCSS has nothing to do with scrambling. CTCSS
is merely a subaudible tone or code which is used to open up squelches
where there is more than one group of users on a channel or repeater.

Scrambling is where the audio stream is "encrypted" somehow.
Sometimes they use dumb stuff like frequency inversion. Anyone with a
soldering iron and a kit can fix that one. Other systems are more
difficult: Motorola's DES encryption is tough to break.

<<The real question is: Will the Attorney General vigorously prosecute the blatant violation of the ECPA..>>

I think that depends, to a great extent, on the media. If their is no noise emanating from the media, then it is likely to die quietly. And, given the media's liberal bias, I don't expect the big papers, radio stations, and t.v. stations to call for an investigation into this. The newspaper articles I have read focus on the conference call and throw in, as an aside, that the conversations was illegally taped.

This may be an odd request. Maybe not.

I am looking for a radio that has all the usual scanning and channel functions of a decent scanner plus having the capability of being a 2m and/or 440Mhz ham rig.

I'm seeing ads for ham radios that suggest that such a thing is possibly in the marketplace.
(I'm outfitting a 4WD rec. vehicle and prefer to keep the number of antennas to something low profile.)

Has anyone else looked closely at these radios? Tell me what you think!

I'm asking the scanner group rather than the ham group because the scanner functions are more important.

Newsgroup: rec.radio.scanner
Date: 1997-01-13 00:00:00 UTC
From: kb5wixnews@aol.com
Message-ID: <19970113004100.TAA10081@ladder01.news.aol.com>
Source record: 212036

For Sale:

ICOM R-1 full coverage scanner (no breaks, including cellular, from 10kHz thru 1300 MHz). Radio is in very good condition except for paint flaking off the back panel. There are no scratches or blemishes on the face or display. Price also includes BP-90 six AA battery pack, AC adapter/charger, original antenna and instruction manual.

Features of the R-1 include:
> Uninterrupted coverage from 10KHz thru 1300 MHz, including military bands and cellular
> Automatic search-and-store capability
> Built in clock with power-on timer and sleep timer
> Signal strength indicator
> AM, FM and FM-wide modes
> Programmable search range
> Selectable steps of .5, 5, 8, 9, 10, 12.5, 15, 20, 30 and 50 kHz

Retail price of an R-1 is $529.95 and the BP-90 is $28, making the package, not including tax and shipping, worth $557.95 (Amateur Radio Catalog, Winter '96/97 edition, page 11). My asking price is $350.00 US. Radio will be shipped free anywhere in the Continental US via UPS.

For questions or to arrange purchase, send e-mail to KB5WIXNEWS@AOL.COM. Mail will be checked daily.

No, no, no. More misinformation. Listen closely - IT IS NOT ILLEGAL
TO MODIFY A SCANNER TO RECEIVE CELLULAR CALLS. It IS illegal to USE A
SCANNER TO RECEIVE CELLULAR CALLS. It is also illegal to manufacture,
import or sell a scanner manufactured after April, 1994 that is EASILY
MODIFIED TO RECEIVE CELLULAR CALLS (in the USA).

Big difference. Well, no, not really a big difference in actual fact,
but a big difference in the way the law is written. :-)

"Ignore?" Of course not. That's where all the information on which talk group is using what repeater is transmitted. Naturally, it won't play the audio from that datastream over the speaker.

Also, the term "guard channel" is nondescriptive. A guard channel is one that a given communication station is required to monitor, such as a distress frequency. The rotating data channel on a Motorola SMR is the control channel.

>2. Is this a handheld model or tabletop model?

They've announced one of each.

Pardon me if this has been asked before, but I'm curious as to what I'm picking up when I enter in, what I'm told is a local police freq. (800 mhz), and it might work fine for a few hours. Then it seems like the next day all I hear from that freq. is a loud, blaring, and annoying sound. I've heard about images, trunked systems and the such. Just wondering if anyone else experiences this noise.

Another item, I'm not interested in monitoring cell phones, however I believe my RS Pro-34 is able to tune them in. What I'm confused at is again in the area of a listed local police freq. after awhile, I'm hearing what sounds like a cell call. More of the same?

I bet a lot of you are wondering just how to get your scanner to get along with your tape recorder. I had this same trouble when I bought my 2005 about three or four years ago. I sat down with both manuals, the one for the tape recorder, and the one for my voice - activated tape recorder.

the scanner`s recording jack was putting out about 100 Millivolts of audio , while the tape recorder only required about 20 MICROVOLTS to activate it. That is quite a large difference ! Needless to say, whenever I plugged the tape recorder into the back of the scanner, if I put it into voice - a ctivate mode, the reels would turn all the time anyway, since there was enough audio coming from the scanner even when it was squelched to activate the recorder.
And when the scanner would un-squelch , the audio from it was so loud that all I would get on the tape was noise !

Here is what I did to solve the problem. It is a well - known fact that any voltage will divide across resistors in series according to the magnitude of each resistor. I decided to take advantage of this fact. So, I took two resistors and hooked them in series, like this:

```
---\/\/\/\/\---o---\/\/\/\/\---
R1 - 100K R2 - 1K
```

Now, if I were to hook this arrangment up across the scanner`s output, we would get the following:

```
Voltage across R1 = 99 Millivolts
Voltage across R2 = 1 Millivolt
```

here is how we would go about hooking this up to the scanner and recorder:

```
|| | braid
lead | | from
from | | recorder
recorder | |
```

I mounted the reistors on a small perf - board I had. The actual level applied to the tape recorder can be adjusted by adjusting the value of R1 slightly. My particular case needed a 220 OHM for R1, which came out just right ! You can make R1 easier and quicker to adjust if you use a 1K trim-pot
However, your particular recorder might need more audio than that. It is possible to just use about a 5K trim - pot for R1 to begin with. Then , you can just adjust it for your recorder`s audio needs. This has worked REALLY WELL for me for quite a while.

How good does the tv amp work. I saw an amp in the Shack's catalog
that boasts of a 14 dB gain on VHF and a 13 db gain on UHF. It also
has four outputs. Do you think that I could run three scanners off
this amp with success?

There are no mods for the '60 short of buying a European version of the logic board from a radio shop in England called Javiation and replacing it yourself. If I remember correctly the board costs around $140.

: I've heard about images, trunked systems and the such. Just wondering if
: anyone else experiences this noise.

Yep. A police frequency in the 800MHz range probably means you've got a
trunked radio system. The loud, blaring, annoying sound is the data
channel for the trunk, and yes it is aggravating. (It's called a buzz-saw
pattern, but personally, I call it a "bus at ten feet" sound.)

You'll need to get all the frequencies for the trunk and punch them in,
then find the data channel and lock it out in order to successfully
monitor the cops. It's a pain. Most of us hate trunks. :)

: Another item, I'm not interested in monitoring cell phones, however I
: believe my RS Pro-34 is able to tune them in. What I'm confused at is

: what sounds like a cell call. More of the same?

In the 800 range, probably yes. It's image response from the cellular
frequencies. 99% of the scanners out there say they can't monitor celltel
calls, but every one I've tried that has the capability to monitor 800MHz
and above has the ability to do so. This is normal.

Cheers,

I have several scanners that have both headphone and external speaker out.
I have a Sony pocket cassette recorder with only a MIC-in, no line-in
jack.

When I patch the scanner to the mick-in jack and press record, it records
alright, but the sound is screwed up. I believe there is an impedance of
level mismatch that should be corrected.

Has anyone come across this, and found a solution?>>>
****
i am not sure on your problem, sounds like a level mismatch to me also...i
use a Pro 2006 with a Radio Shack Micro-51 Voice Actuated deck....i
connect from the out on the 2006 to the mic in on the deck, and set the
Voice Actuation level to Hi...and it works perfectly....

>
>
> Tommis@aol.com
>

PL tones refers to the trademark Motorola Private Line or PL for short. GE
terms PL and Digital Squelch. PL uses Continuous Tone Coded Squelch
System. When a radio is transmitted, it sends a subaudible tone with the
normal conversation. The audio frequencies used by CTCSS basically lie
between 67.0 HZ and 254.4 HZ. Only receivers' squelch could be open with
the correct CTCSS tone. This is best for business that have to share a
frequency in a given area. Other uses for CTCSS is to activate repeaters.

You will need to modify the scanner to accept PL tones.

1467. FS: ICOM R-1 Full Coverage Scanner

Newsgroup: rec.radio.scanner
Date: 1997-01-13 00:00:00 UTC
From: kb5wixnews@aol.com
Message-ID: <19970113031700.WAA14497@ladder01.news.aol.com>
Source record: 212055

For Sale:

ICOM R-1 full coverage scanner (no breaks, including cellular, from 10kHz thru 1300 MHz). Radio is in very good condition except for paint flaking off the back panel. There are no scratches or blemishes on the face or display. Price also includes BP-90 six AA battery pack, AC adapter/charger, original antenna and instruction manual.

Features of the R-1 include:
> Uninterrupted coverage from 10KHz thru 1300 MHz, including military bands and cellular
> Automatic search-and-store capability
> Built in clock with power-on timer and sleep timer
> Signal strength indicator
> AM, FM and FM-wide modes
> Programmable search range
> Selectable steps of .5, 5, 8, 9, 10, 12.5, 15, 20, 30 and 50 kHz

Retail price of an R-1 is $529.95 and the BP-90 is $28, making the package, not including tax and shipping, worth $557.95 (Amateur Radio Catalog, Winter '96/97 edition, page 11). My asking price is $350.00 US. Radio will be shipped free anywhere in the Continental US via UPS.

For questions or to arrange purchase, send e-mail to KB5WIXNEWS@AOL.COM. Mail will be checked daily.

1468. BC144XL VOLTAGE QUESTION???

To any and all:

I just received a Bearcat BC144XL, not top of the line, but is fine for here in the boonies. The voltage transformer converts 120 VAC to 10 VDC for base use. A cigarette lighter adaptor is available for mobile use.

My question, is 12 VDC too much and am I risking damage to the scanner? This is a 20% increase in voltage. My old Bearcat was 12 VDC for base use.

Any information appreciated.

Thanks,
Dayton Parker

There is at least one city in my area that has police, fire, and city
operating on one trunked system and they have the ability to use a
phone patch to make a phone call through the trunked system. You can
hear city workers making personal phone calls all the time on it. They
sound just like a cell phone call but are not. The ECPA probably
wouldn't apply to this type of transmission since they are using a
public safety frequency.

It can be quite annoying when monitoring a high speed chase or
something and then have your scanner change frequencies and lock on a
phone call.

I can't comment about the ECPA, since I'm Canadian and take a minimal interest in American law, but it would seem to me that since we're supposed to keep our mouths shut about what we hear on the radio anyway, we *still* couldn't tell anyone about it.

There was, on one trunk, a way to figure out if it was a celltel conversation or something patched through - wait for the end of the transmission and listen for the beeps. (This was a Motorola trunk that had a profoundly annoying beep.. beep.. beepbeep at the end of every transmission, which made it %#*@ing impossible to scan it successfully.) I heard a couple this way before I got sick of trying to scan the trunk and turned it off on my scanner. :)

Either that, or listen for the signal to fade out and the cell hand-off tones to sound. (You know, those AHNK AHNK tones.)

: It can be quite annoying when monitoring a high speed chase or
: something and then have your scanner change frequencies and lock on a
: phone call.

Having EMS (one of my more favoured services) on a trunk with snowplows, dog catchers and meter readers was, to put it mildly, fucking irritating. Now, I just have two surrounding PDs on *the same trunk* with transit and a bunch of other yahoos. Regardless, I'm starting to learn how to decipher trunk transmissions - I think it just takes time to get used to the voices of the dispatchers and of the mobile units.

Not compatable with LTR, EDACS and ESAS systems
Does work on Both Motorola systems. (they say). You
can enter up to 10 systems at once but can only monitor
one system at a time.
29-54mhz, 108-174mhz, 406-512mhz, and 806-956(less cellular)
2 rechargeable battery packs.

Base Model is BC895xlt and is due out in the summer 1997.
300 channels
Built in CTCSS with and RS232C port. About the same
price.

Body handling: Inline uuencoded payload not displayed: scan2.txt; Inline uuencoded payload not displayed: swp20.jpg

I am selling my BC700. It's in perfect condition, with box, docs, and all accessories. Just one too many scanners. First $130 US takes it including shipping ground/UPS/USA. Red or Fedex can be negotiated. If interested, email me and I'll give you TX numbers and credentials. I'm attaching a jpg of the scanner, and a txt copy of an ad from scanner world for this rig so you'll have all the specs. It is unmodified, but I heard rumors that it can be restored. I just don't care about cellular that much, having been a cell tech for a long time.....

Take apart the upper half of the discone and make sure that water has
not collected inside of the coaxial assembly. Mine did, so i took it
apart, dried it off and fitted o-rings to the threaded pieces. Worked
much better with out all the water. By the way, the discone should be an
open circuit if measured with an ohmmeter, if you see a short or leakage
like a capacitor then some water got in.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

To order a user manual for an Electra/Bearcat scanner, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know

if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold.

That's an attempt to limit the current drain on weak NiCds
to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board,
adjacent to the black multi-pin connector which mates the
Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily,
by something in the scanner drawing too much current
through it. In one case, capacitor C36 shorted. It's a 220
uF 10v electrolytic, located on the component side of the
main board, connected from pin 8 of the audio IC (IC2
NJM386SL) to ground. Capacitor C55 shorted in another |
BC200XLT. In a pinch you bypass Q201 by soldering a short |
piece of bare wire between the collector and emitter, but |
you must first fix the component which caused Q201 to fail.

Other Problems

Complaints of low audio output and occasional microphonics
in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd
electrolytic capacitor in series between the external
speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder
connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier
activated relay inside the BC890XLT wore out. Andy found
the identical relay sold at Radio Shack (part #275-232) and
says the BC9000XLT uses the same relay, too.

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units

unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot

on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - Icom R8500

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical

relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the

schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Rugged construction. External power supply. DB25 RS232C connector. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be

arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft

bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. | For a full review, see "The Uniden Bearcat BC9000XLT," by | Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity.

Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable

performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

RELM

1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 50 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt

alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart

Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. Watch for review by Bob Parnass in future issue of Monitoring Times magazine.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a

transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included

oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by

Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of

interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping | and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard | or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Hey all,

I was just curious if anyone could help me find a list of Walt Disney World Frequencies....

My uncle is going to Disney in Florida in may, and allways takes his scanner. I think it's a full bandwidth thing, going up to 800MHZ or whatever....

i know so little about these things.... :(

Anyway, thanks for the help..

instead of trolling it along... ;)
just say and be done with it...
trunked tracking scanners _internally_register_ the control band...
...and dependant on how registered,,,
...the scanner then knows what to follow, where and when...

Gerry,
Just wondering if you know how reset the old freqs that were
programmed into it when I bought it. I bought it from a guy and every
time the batteries run out it wipes out the freqs I've entered and
resets to the original ones. I assume it has a backup battery in it
or something. It is model BC 100xl portable. (an oldie)
Thanks in advance. (dms@admin.drake.edu)

Yes, you can hear yourself, or friends order... but the big
thing for me, is to listen for the off color remarks that the staff
at the drive thru make. One evening, while listening to a drive
thru waiting to place my order, a friend of mine and I heard the
clerks discussing between themselves whether black or white women
had better breasts. You name it, you will hear it at the drive
thru. The real fun comes when you freak out one of the clerks by
commenting on something they say about the previous customer...
they start worrying that they might have said something that went
out over the intercom to the customer... this has a chilling effect
on the clerks. There is also what others have posted, the enjoyment
of tracking down the frequencies. I have heard the clerks make
comments about the staff at the fast food store as well... so, it
is very interesting. Just my $0.02...

1503. WTT: Steinberger guitar for radio scanner

Newsgroup: rec.radio.scanner
Date: 1997-01-14 00:00:00 UTC
From: RB <rbeer@ibm.net>
Message-ID: <01bc01cb$f1a766c0$60d248a6@richardb>
Source record: 211737

(Please accept my _sincere_ apologies if this is posted out of context:)

I have a Steinberger electric guitar that I would like to trade for a radio scanner. Here are the details on the guitar:

Steinberger, (unknown model year, serial # available upon request), wooden (Ash, I believe) strat-shaped body, black, composite neck with no headstock, s-trem tremolo. EMG H-S-S pickup configuration. Condition: 3-3.5 out of 5 (some buckle wear on the back of the guitar, light pick-type scratches on the face).

All offers will be considered. I'm very new to the scanner hobby and would ideally like to trade for a non-mobile, fully-featured scanner.

Thanks,
Rich

Well, if you possess stolen property and you know it was stolen, you're as
liable for convictioin as the actual thief.

Likewise, if you possess and knowingly disseminate information that was
illegally obtained and illegal to disseminate, you again become part of that
felony and liable to prosecution.

1505. Austin Ferret Base Antenna....any good?

Newsgroup: rec.radio.scanner
Date: 1997-01-14 00:00:00 UTC
From: jbriggs@cvn.net
Message-ID: <5bh4tn$1n3@jimmy.zippo.com>
Source record: 211739

After much feed back on this news group, I have decided to get
an AR-8000 and I would like to thank all those that responded!
My next question is how good is the Austin Ferret Base Antenna?
This antenna sells for over $200 at Grove and seems like a very well
built piece of equipment and has the range of freq. I'm looking for.
But before I shell out this kind of money, I'd like to know if anyone
out there has one of these or knows someone that does and what the
pros and cons of it are.
Any feedback will be greatly appreciated!!

(PS) I have a RS Discone antenna of which I've added a modified CB
antenna to the top of it. It helped alot for the 30 to 50mhz range and
I plan on keeping this antenna for my current scanner the PRO 2036.
Thanks to those who helped me with the mod!!!!

> Jeff

I don't think I made myself clear as to what I was looking to do.. I want to use my handheld scanner with the clip-on speaker sold by Radio Shack (looks like a speak/mic used by police, but works only as a speak). However, the problem is this audio limiter built in to the earphone circuit of the BC200XLT prevents the unit from generating any volume on an external (non-amplified) speaker. There is a local shop near my work that says they can disable this limiter for $20.00, but I thought it might be something I could do myself (clipping a resistor is not all THAT difficult, right? <g>)

I will probably just have this local shop do the modification, since without knowing exactly what I am looking for I am a little reluctant to open the thing up and start poking around, snipping things...

Message-ID: <slogan-1401971505580001@pm2-17.northlink.com>
Source record: 211746

I saw a preproduction model of the Relm mobile scanner at the Winter CES. It is 1/3 to 1/4 the size of the BC-9000XLT. It is Alphanumeric & includes CTCSS/DTS. On the back is an RS-232 port! Two hundred channels and the other variables are the same as on their handheld. This unit will be made in Japan by Yuperitu. Pricing will
be about the same as the handheld and deliveries are expected for 2nd quarter.

Spoke to EDCO, they have the AOR7000 in stock for the last 60 days. They are still awaiting FCC approval. They stated the FCC is being much more difficult about scanners that easily allow the end user to circumvent the ECPA. Pricing is $1399
MSRP.

Chatted with Grundig about the future of their shortwave No. 900. They said it would go into production in 1998.

Others have already discussed the Bearcat Trunktrackers.

Unfortunately it happened to the majority party in Congress. What's to keep them from proposing legislation to further restrict our hobby if not take it away from us outright? If it happened to the Democracts they would be crying foul too.

These two idiots in Florida may have opened a can of worms that didn't need to be opened. Public agencies are already paranoid about my listening to them pulling over a car for a traffic violation.

As much as I like listening to my scanners and listening to things I probably shouldn't be listening to, I hope these morons are prosecuted and everyone else that is involved.

Rolo.

Hi, Scott!
I have a bc100xlt, and have done something smart, I think.
I have put new, chargeable batteries in the compartment and put a switch
on the radio. With the switch in first position, the batterie are
charged from the DC input connector (which I also canged of coarse
because the miniJack is much better in the long run...). With the switch
in second position, The radio is given power by the external power
WITHOUT CHARGING THE BATTERIES AT THE SAME TIME. This prevents the
batteries to be charged every time I wish to use the receiver, and also
to enshure that my battery is allways fully charged when I leaving home
with it.

Regards, Tore

The Martins of Florida have now appeared on television and radio talking about their interception of the Gingrich telephone conversation.

On NPR, they stated that they were using a scanner 'just purchased at Radio Shack'. But I have still not determined whether they were listening to cellular via image response in the receiver or a 49-mhz cordless telephone.

Their lawyer stated flatly on ABC TV (Good Morning America) that both Federal and Florida State law prohibits what they did.

Jeff,
I own one of the Antenna Specialists antennas, magnetic mount,
and it works quite well as an indoor antenna, sitting on top
of a metal cabinet. I kept the original length of Belden RG58, which
is probably around 12 feet or so (it just made it from dash-board
to trunk). Because RG58 is such a poor performer a higher frequencies,
I would go back to what the manufacturer intended...maybe a tad shorter
if possible.
Another thing to consider is the quality of the RG58 you are now
using; you may want to obtain something better (like Belden).
In this particular case, I would not jump on the 75 ohm bandwagon
either.
These antennas are of the tuned trap variety and, heck, for the cost
of a small quantity of cable, why mess with success, IMO.
And yes, I do run 75 ohm in OTHER scanner antenna applications, for
pretty
much of the same reasons mentioned in this newsgroup.

You are right, a rash of bad legislation will probably be proposed.

I find it ironic and a most sorry state of affairs that the release of this tape came about after it had passed through the hands of his party's senior representative on the House ETHICS committee! In direct violation of the Communications Act of 1934, not to mention that silly thing they passed in the '80s. Another case of Congress' not following its own laws. And they wonder why the public are so disillusioned with them!

I want to see him do jail time and pay a $10K fine here, under the Communications Act's "thou shalt not use or divulge the content of communications that are not addressed to you", not the [unenforceable] scanner law's "thou shalt not listen to cell or portable phones". Since that law is unenforceable, it ought not be on the books. And if the cell phone builders wanted them to be private, they should have built encryption into them in the first place. They ought to come with a big fat warning label.

And now that couple are giving a press conference with a lawyer / spin doctor coaching them, pleading that they are sweet and innocent, and only wanted a piece of history. Give me a break! Tell it to the jury.

Has it been divulged what model scanner it was? Even if it *was* a new 800-blocked one as they said, it could have picked up the cell phone on an image.

RG-8 is worth it; look for "foam" RG-8, which has a little less loss
at about the same price. There's also RG-213, a nicer version with
a better shield. (Some of the RG-8 has a very sparse braid.)

You could also go for 9913, the "poor man's hardline." The difference
in price from one to another is about the cost of lunch at a fast food
joint.

I use a discone with 9913 and a short length of RG-58 to a handheld
scanner. Works for me.

I'm finding more and more freqs. in my area and have been considering an interface for my PRO-2005 scanner. Has anyone bought or tried one such as the HB-232 interface? I found others like the SCANCAT 5.0 and SCANCAT PRO by Datametrics but seems to claim use only with PRO-2006 scanner! I'm still trying to figure that one out. These should almost be alike inside but then I could be wrong there. I've read about the HB-232 interface and for $195 + s/h, it seems to have a lot of features, not to mention about 20 wire that have to be hooked up inside somewhere. Any info / advice on these would be very helpful. I just wanted to see how many people own these. This even comes in kit form I noticed. Thanks for reading.

Hey gang, I thought it was illegal to listen to cell phone calls. I guess not:

*** Florida couple heard Gingrich on car scanner

A Florida couple active in local Democratic party politics said Monday they gave a tape of a conversation between House Speaker Newt Gingrich and his top allies referring to ethics charges against him to the senior Democrat on the House ethics committee, Rep. Jim McDermott of Washington. The conversation was picked up on a police scanner on Dec. 21 near Jacksonville, Fla., and taped with a pocket-sized recorder from their car. When asked why they taped the conversation, John White said, "We just thought it was a part of history." For the full text story, see http://www.merc.com/stories/cgi/story.cgi?id=1106926-fae

1531. coax & signal loss

Newsgroup: rec.radio.scanner
Date: 1997-01-14 00:00:00 UTC
From: frog200@juno.com
Message-ID: <5bh0un$mdc@news.wco.com>
Source record: 211765

Here are the "facts" on coaxial cable and receiver signal loss:

Receiver sensitivity is measured in microvolts of signal, measured
at the receiver antenna input jack.

Coaxial cable attenuation (loss) is measured in decibels (dB) at
specified frequencies and cable lengths. (Coaxial cables have higher
loss at higher frequencies).

The unit of dB is used to define or measure the ratio between two
voltages. The mathematical relationship of dB to microvolts (uv) is
given in the formula:

dB = 20 x Log (uv2 / uv1),

where uv2 and uv1 represent the two voltages (signal strengths)
we wish to compare, (uv2 being the larger value.)

Some Examples...

Let's say that your receiver has a defined sensitivity of 0.25 microvolts.
Lets also say that you plan on using a 50 foot run of Radio Shack RG 58/U,
solid center conductor cable with foam PE dielectric. The question: you
want to know how much signal at 400MHz will get to the receiver after
traveling through this amount of this coax. The 1996 Belden catalog
shows that loss of this cable at 400 MHz is 9.1 dB per 100 feet. For
50 feet, the loss would be half, or 4.55 dB at 400 MHz. Plugging in the
two known values of dB and receiver sensitivity spec of 0.25 uv into
the above equation would show:

4.55 dB = 20 x Log (uv2 / 0.25) .

Using algebra to put the unknown value on one side gives:

uv2 = [AntiLog (4.55 / 20)] x 0.25 .

solving gives a value of .42 uv for uv2.

This means that it will take a 400MHz signal of .42 uv at the antenna
to put a signal of .25 uv at the receiver jack

A rule of thumb: a 6 dB loss cuts your signal in half. (It would
take a 0.5 uv signal at the antenna to put 0.25 uv at the receiver.)

For longer coax runs, for higher frequencies, and for cables with more
loss, the required antenna signal input goes up dramatically higher.

The key to optimum signal strength at your receiver input jack is to get
the lowest loss cable with the highest frequency ratings you can afford,

and to minimize the length of cable you use.

A specifications chart of the more common RF cables used in scanner and DSS receiver installations follows. These figures are taken from the 1996 Belden Cable catalog.

==========

Center dB loss per 100 feet at:
Coax Type Imp. Conductor Dielectric 50MHz 100MHz 400MHz 1000MHz

RG 6/U 75 solid poly- 1.9 2.7 5.9 9.8
(8215) ethylene

RG 6/U 75 solid gas foam 1.5 2.0 4.0 6.5
(9248)

RG 8/U 50 7x19 foam 1.2 1.8 4.2 7.1
(8214)

RG 8/U 50 solid foam 1.1 1.6 3.5 6.0
(9914)

RG 8A/U 50 7x21 poly- 1.3 1.9 4.1 8.0
(8237) ethylene

RG 8/X 50 19x29 foam 2.5 3.7 8.0 13.5
(9258)

RG 11/U 75 7x26 poly- 1.3 2.0 4.2 7.1
(8261) ethylene

RG 11/U 75 solid foam 1.0 1.5 3.2 5.4
(8213)

RG 58/U 50 solid poly- 2.5 3.8 8.4 14.5
(8240) ethylene

RG 58/U 50 19x32 foam 3.2 4.5 10.0 18.0
(8219)

RG 59/U 75 solid poly- 2.4 3.4 7.0 12.0
(8241) ethylene

RG 59/U 75 solid foam 2.1 3.0 6.6 10.9
(9240)

==========

There are too many of each type of coax to list here. There are 22 types of RG 6/U cable alone listed in this catalog!) This is just a sample of the more common types available. I didn't address shielding, which shouldn't be a concern unless your station is subjected to interferance from a source leaking through the coax shield. Also, (I believe, but haven't confirmed mathematically) that the use of 75 ohm cable on 50 ohm receivers will only produce a minimal loss of less than a dB or two.

(Its late and I don't want to do the complex math now.)

As a rule of thumb, get the foam dielectric cable, and solid center conductor, (unless much flexing is anticipated.) Also, less loss if you can use BNC or N connectors rather than the standard UHF fittings common to many radios. TV type F connectors are ok and inexpensive.

Message-ID: <5bfesf$4rk@shiva.usa.net>
Source record: 211767

I'm considering the purchase of an AOR AR-8000 but I'm a bit confused by the computer interface that is provided with the system. If i want to hook my AR-8000 up to my computer and control it with ScanCat or a similar package what do I need? Is it a simple serial cable? I plan on getting the Scout reaction tuning modification, but I've also seen several mods mentioned to control the scanner via computer, which led to my confusion, as I thought it had a serial interface that could simply be hooked up with a serial cable. Is this true? And if so, what do other sorts of computer interfaces provide you that the built in interface doesn't?

I recently bought a used 2006 and the 456 board based on a demo I had of
Probe. I had looked at demos of Radio Manager, ScanStar, etc., but they
didn't seem worth the time and effort.

For decoding ctcss and dtmf, for capturing the data and retrieving it,
and for building a database using the Percon cd-rom, it's really hard to
beat Probe. I have been very satisfied in the short time that I've been
using it. Yes, it's extra dollars, but consider your requirements.

Regards.

In multi- department systems, they're used to break squelch on only
certain radios (or groups). The radio only "opens" when its'
sub-audible tone is transmitted. As a scannist, unless you have some
reason to NOT listen to a particular group of transmissions that are
on a common frequency with others you DO want to listen to, and the
system uses PL, there isn't much need to be concerned about them.

Gosh, I am confused. If it is illegal to buy a scanner that can receive cellular calls, how this couple have POSSIBLY monitored Newts call??? Isn't that Illegal? Wasn't Newt in Congress when both the ECPA and the cellular capable scanner was ban was passed? I say, "Welcome to the jungle you stupid bastard!" Bad karma Newt, bad Karma.

So if you did interface it to a computer, what would it buy you?

The frequencies are not programmed from control head to radio on the fly, but are programmed via a very slow process from RSS to radio EEPROM. The control head simply selects the mode information already in radio EEPROM.

The radio will scan using the existing control head.

The radio will display mode names using the existing control head.

The radio will allow selection of multiple PL tones/codes using the existing control head.

It seems like after going to quite a bit of effort to reverse engineer the bus protocol you could make a radio control head out of your PC. To me it hardly seems worth the effort.

On the other hand, it's the top Democrat in the _ETHICS_ committee who committed a _felony_ (right?) whose victim was a subject of his investigation. Republicans will be screaming for his head on a platter.

> How is it this call was "accidentally" intercepted anyway?

I'd allow for accidental. There's a lot of calls, and apparently a lot of scanners running. It's like the number of incredible things that are caught on videotape - I keep thinking "there's THAT MANY cameras running?"

Thanks to those who have replied by email. I wasn't very clear I guess.

Let me rephrase the question-

I know that 2m and 440 radios have scanning features. (My antique
Icom 02AT HT will scan if you watch it long enough.)

But what I'm interested in are the buttons and knobs that make it easy
to use the scan features. My intended use is for installation in a
truck. I want pretty much what my Uniden 590XLT scanner has:
scan, manual, hold, priority buttons. Channels organized into banks,
the ability to move a found-by-frequency search item into memory with
the touch of about 2 buttons. Channel lockouts. Channel delay settings.

You know..... scanner features.

I think an HT is not what I want. Most of those buttons require a stylus
to push anyway :-) And I prefer that it not be terribly complex.
I can hardly remember how to use my FT-411E each time. (It rides in
my backpack when hiking or motorcycle tank bag when riding.)

So, sorry to repeat, but can anyone refine their answer now that I've
refined the question?

Ron

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for *
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own. |

This introduction is intended for people new to the |
scanning hobby and is oriented to scanning in the USA. |
High level overviews of the following topics are presented: |

Why Scanning? |
Is Scanning Legal? |
What Scanner Should I Buy? |
What is a CTCSS and DCS Tone Squelch Feature? |
Scanner Antennas |
Coaxial Cable Feedlines |
Where Can I Buy A Scanner? |
Modifying Your Scanner |
Scanner Repair Shops |
Where Can I Obtain Frequency Information? |
Do Your Own Frequency Detective Work |
How Can I Use Equipment to Uncover New Frequencies? |
Scanner Clubs and Mailing Lists |

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,
taxis, and buses are all equipped with radios and you can

listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell or import recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in

semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the

action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature |

Upscale scanners can be optioned with a subaudible tone | decoding squelch circuit. There are two types: CTCSS | (Continuous Tone Coded Squelch System) and DCS (Digital | Coded Squelch). In simple terms, this feature lets your | scanner ignore signals you don't want to hear. |

CTCSS and DCS signals are transmitted subaudibly along with | the voice information on most land mobile two way radios | (except trunked systems). |

You can program a specific CTCSS or DCS code into each | memory channel. Using a CTCSS or DCS decoder permits your | scanner to open the squelch only if the transmission has a | code which matches the code you program. |

CTCSS and DCS decoding offers several advantages: |

1. Ignore unwanted signals on shared frequencies: It is | common for several users to share the same frequency, | e.g., my county sheriff uses the same frequency as | Chicago Police, located about 60 miles away. I want | to hear my sheriff's transmissions but don't want the | scanner to stop on or listen to Chicago Police | transmissions. This is especially a problem when | radio propagation is good, e.g., during a "band | opening," when reception range is temporarily | increased. |

2. Combat intermodulation interference: Helps keep out | intermod and image interference from strong pagers | and other signals because they are not transmitted | with a matching code. |

3. Ignore scrambled transmissions: Many federal law | enforcement agencies (FBI, Secret Service, etc) and | some local police agencies employ digital voice | scrambling, which sounds like white noise and is | annoying to listen to. The CTCSS or DCS code is sent | only when the station is transmitting unscrambled, or | "in the clear." You can program federal frequencies | along with the proper code into your decoder-equipped | scanner so you won't have to listen to the scrambled | mess and only hear their transmissions when they are | unscrambled. |

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be

supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are

offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone

jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche

records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain selected business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with

Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping | and handling. For an additional $5.00, I will include a | custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard | or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either

automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15

annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call Plust is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed full of police, fire, local government, news media, sports,

national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC

information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping | and handling. For an additional $5.00, I will include a | custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or

money order payable to Bob Parnass for $29.95 for standard |
or $34.95 for deluxe RadioMap report with histogram.
Include your name, address, and telephone number, along
with center location (nearest intersection of 2 streets, or
latitude & longitude) and mail to: Bob Parnass, 2350
Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM
central time. For a brochure, send SASE.

If you have access to the World Wide Web, you can visit |
dozens of sites with local frequency lists. Rob Barron |
maintains an interesting site at www.exo.com/~rbarron. |

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by
the FCC, they are not listed in FCC microfiche. In 1981, a
group of 60 radio hobbyists split a $1300 fee, and obtained
80 microfiche cards of 'sanitized' information about
federal government radio stations under the Freedom of
Information Act (FOIA). (See "The Government Giveth, the
Government Taketh Away", by Richard Prelinger, in
Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were
furnished. Fields like "Remarks", which indicate the exact
usage of a channel (e.g. "Sky Marshall's Net"), and
"Bureau", indicating agency subdivision (e.g. TAC within
the USAF), were withheld. These 80 pages of microfiche
were sold by Grove Enterprises for $25, but are no longer
available from that source. Private entrepreneurs have
been known to ask $125 or more for a set! In a step
backward, the US Government insists it will no longer
release this type of information - it is now 'classified'.
(See "AFIO and the FOIA", by Bob Grove, in Monitoring
Times, September 1982.)

For a reason unknown to this author, the government
released a 1984 vintage set of frequencies allocated to the
FAA. Perhaps this was a mistake, because the information
is marked 'unclassified', but all fields are furnished,
including some which indicate security related usage.
Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces
often appears for sale at hamfests. Less often, Secret
Service and FBI radios appear there from time to time, too.
When you see such equipment, look over the radio for a
frequency label and write down the frequencies stamped on
the crystals or channel elements. Make note of any service
or property tags which specify the agency or military base

which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was

on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping

transmissions, scanner enthusiasts can unearth new
information.

Gotta agree. I worked at McD's while in High School, and we talked some
NASTY SHIT that the customers never heard.

Ex. The first of the month rolls around and a car with a huge fat woman
with 7 kids pulls up. You say on the intercom, "I see you got your
welfare check, may I take your order!"

Kinda crude, but funny as hell!

Erin

1566. WTB: RS Pro2005 or 2006, RS Pro26 or 43, AOR2700 or 8000 In good condition

All, I am looking for a good high-end scanner. Cellular capable or modifiable preferred.

Email me with any you are ready to part with.

Thanks,

Greg Etchell

In today's New York Times there was a full page ad for a digital phone that is not cellular. They used this case to argue for their "encrypted" digital system.

Regulation is not necessary. The free market can take care of itself, just fine.

...Peter

I suppose you don't have a problem with the endless lies and deception our
LEADERS are spewing out?

Isn't there a much bigger issue here?

And, these "leaders," aren't they smart enough to know that cellular calls
can be listened to? I'm not expecting them to be engineers, you know, but
some basic technical knowledge by our lawmakers, of perhaps the
technology leading country of the world, would certainly be a good thing.

I purchaced a Scanner from Radio Shack (PRO-2030) and it scans the Cell
frequencies (with no modifications done to it)

OR, on the other hand, it could finally show the ECPA for the unenforceable paper tiger that it is and get this nonsensical piece of legislation removed from the books.

If the powers-that-be choose not to prosecute this "North Florida Couple" for blatantly violating the ECPA, the message will ring through loud and clear to everyone else that the law is truly toothless.

It is the original act that the interceptors and whoever they passed
their tape to, including the Times, violated.

Thanx for the suggestions, thus far for anyone jsut joining or with a similar question I have gotten the following 3 locations. Of which 2 had the model I was looking for (readily availble on-line) and of those 2 , the ACE Comm price is about $35.00 less than that at Scanner World. (Model in question is the BC80 XLT) I plan to call Grove and see if they carry the unit.

Thanx for the help.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

character in the right margin. |

REPAIR TIPS: RADIO SHACK SCANNER RADIOS |

Copyright 1997 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in |
part on CDROMS, in bulletin boards, networks, or |
publications which charge for service without permission of |
the author. It is posted twice monthly on the USENET |
groups rec.radio.scanner, alt.radio.scanner, |
sci.electronics.repair, and rec.radio.info. It is also |
available electronically from the rec.radio.scanner ftp |
archive on the official USENET FAQ library |
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. |
The author writes a monthly "Scanner Equipment" column for |
Monitoring Times magazine, published by Grove Enterprises, |
but views expressed in this article are his own.] |

Introduction |

Radio Shack has been selling scanners and monitor receivers |
under the Realistic and Radio Shack labels for over 30 |
years. Most of them were manufactured by General Research |
Electronics of Tokyo, though many newer models are |
manufactured by Uniden. |

The date of manufacture is usually printed on a gummed |
label on the scanner as well as the cardboard box. A code |
of 5A95, means the scanner was made in the 5th month of |
1995, for example. |

There's another way to date Radio Shack scanners |
manufactured by Uniden. The first digit of the long serial |
number is usually the last digit of the year of |
manufacture. |

Schematics, Owner's Manuals, and Parts Available |

Service manuals for most Radio Shack scanners may be |
ordered through your local Radio Shack store. |

If Radio Shack doesn't have a schematic, try obtaining a |
Photophacts from Howard Sams Publishing division of |

Prentice-Hall at (800)428-7267. |

Parts may be ordered through your local Radio Shack store |
or through Tandy National Parts, telephone (800)442-2425. |

G & G Communications (telephone (716)768-8151) is a family |
owned company which repairs scanners and stocks parts for |
several older models, especially Electra/Bearcat and |
Regency brands, but they don't sell manuals or schematics. |
They are located at 9247 Glenwood Drive, LeRoy, NY 14482. |
(http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or |
ggcomm@aol.com) |

Dim Backlight in Base Models |

The backlight in many base models, including the PRO-2022, |
PRO-2004, and PRO-2005/6 is implemented by an |
electroluminescent panel, which grows dim with use. |

The EL panel used in the PRO-2005 and PRO-2006 is |
designated EL-501, and is identified by Radio Shack part |
#10800050. A new EL panel can be ordered through your |
local Radio Shack store and sent to your home for about $12 |
plus shipping. Radio Shack no longer sells replacement EL |
panels for the PRO-2004. |

Replacing the backlight is an operation which requires care |
and patience. The service manual has an exploded parts |
diagram which is helpful in showing how to disassemble the |
scanner. |

Worn Out Keypads on GRE-Made Portables |

The keypad on late model GRE-made Radio Shack portables, |
e.g., PRO-39 and PRO-43, can become unreliable after |
prolonged use. The best repair is to replace the rubber |
keypad instead of trying to restore contacts using |
chemicals. A replacement rubber keypad may be ordered |
through your local Radio Shack Store for about $4.00.

> OR, on the other hand, it could finally show the ECPA for the
> unenforceable paper tiger that it is and get this nonsensical piece of
> legislation removed from the books.

While it would be great to see this happen, the governmental trend seems to be 'continually moving forward.' Why repeal something already on the books if you can augment it by simply rendering any related hardware illegal?

I have little faith in the government to do the right thing. The govt. has PROOF of illegal action here, and sits on it? Hah. And the press... They're no help. Hell, this couple (democratic allegiances aside) is being paraded as victims in all this. Just watched NBC Natl. news discussing 'the scanner issue' this evening.

You can count on one thing.. regardless how this turns out, we're screwed.

The following letter is being sent directly to officials at HCSO. However, I thought it might be of some use to activists in other communities that have gone, or are going trunked with an emphasis on public isolation.

Hillsborough County Sheriff's Office
Cal Henderson/Steve Mitchell/"John"
Post Office Box 3371
Tampa, Fl. 33601

January 14, 1996

Re: Respectfully Object

Dear Mr. Henderson:

I am writing this letter to express disappointment and shock at the apparent policy of the Hillsborough County Sheriff's Office to prevent its citizenry from passive monitoring of your basic patrolcasts. The recent upgrade to an 800mhz system is a standard advancement that, in its implementation, often makes it more difficult for the public to eavesdrop. Your department is not unique in building this system. The idea of unifying county communications under a single communications network is both noble and efficient. It is consistent with the technological integrity of HCSO, which is superior.

What is unique to HCSO, however, is its apparent hostility and judgment against public monitoring. It would appear that at every intersect of implementing the new system, the agency has opted for the solution that most frustrates scanner users. The statement is clear: the agency does not want John Q. Public overhearing patrolcasts. The system HCSO is implementing not only trunks each transmission, but includes the infamous GE Ericsson scanner-blocking "buzz-saw" which serves no technological purpose whatsoever except to frustrate scanner listeners. Furthermore, there is talk that what little voice communications die-hard samaritans may continue to pursue, will be encrypted. If the structure of the system were not enough, then perhaps the rather unfriendly comments made by "John" , who I understand is the head of the Hillsborough project at GE Ericsson, do convey the message. According to John's very words during a probing telephone conversation in which I sought to purchase an Ericsson radio, your agency is trunked to thwart "people like me". A complete mistruth. Agencies go trunked in order to make more efficient use of the frequency spectrum, and trunking in and of itself does not imply encryption.

He wasn't specific in defining the context of what "I" am, but I'll give him the benefit of the doubt and assume for the moment he meant a cop-wannabe scanner nerd with just a tad too much time on his hands; and not the largely pro-police, law-abiding, general citizen of Hillsborough County who simply likes to be the first to know what's going on whenever possible - and by the way, who may take to voting next election. I don't know to what extent John speaks for the department in defining policy on this issue, but he has assured me that HCSO will in fact allow "select" members of the media to buy these radios, and have them programmed.

Try to understand my passionate feelings on this issue, and my frustration, when I ask the following in complete sarcasm. I am rarely this rude in official correspondence. However, GE Ericsson is a major international corporation. I have to ask: was John last stationed at the GE Ericsson office of the former Soviet Union? There he might not have thought it unusual to make such an outlandish resolve. No joking. I only wondered why he didn't punctuate that comment with an evil laugh!

Indeed, per the article appearing in the January 14 issue of the Tampa Tribune, which I was fortunate enough to contribute many sources of information in an effort to help draw attention to this matter, HCSO does intend to make its programming services available to the "select" media. I assume by comments also made by John that this will include "select" crimewatch organizations. And I can certainly infer that this will include "select" members of the local political infrastructure, as well.

It is uncomprehendable that I will ever fully convey how I feel regarding the right to receive "pure" information and decide issues for myself. John doesn't seem to understand, as may not the department in general, that I am the media. To suggest that people should be satisfied with the limited resources, selective content, and subjection to prevailing political relationships with which the "select" media is in constant struggle, is short of outrageous. I have a slight objection to being a mental slave of Willard Scott. He's great with a cup of coffee, but he and no one else should ever be allowed have exclusive privilege over whether or not I will be told a circle is a square.

My points should demonstrate that there is something more disturbing than the fact that a technical revolution on your part will render my conventional scanner unusable. In short, it's the HCSO philosophy. As discussed in the Tribune article, many agencies regard patrolcasting as a tangible community benefit. Indeed, I believe the process of community policing is more than simply doing and saying whatever is necessary on paper to continue receiving juicy federal dollars. I believe it is taking the initiative and investigating new innovations, and applying no small amount of creativity in communicating with the public. New York's impressive decline in crime, whether you feel that social factors played some role or not,

was based in part on a philosophy of innovation -- not the exclusive implementation of whatever tactic appeared in the last issue of the FBI Law Enforcement Bulletin. New York City led, not followed, itself to a solution using what I describe as "proactive policing".

Locally, Community Policing is the tout, but I find it a stark and dark contradiction of the community policing agenda to value isolation of the citizenry at the basic level, even if HCSO has done a superb job in implementing the doctrine otherwise. It simply makes no sense. The ability to monitor patrolcasts using inexpensive radios was the accidental but first demonstration of community policing. When police agencies first began using radio systems at the high end of the A.M. band some 60 years ago, it was not uncommon for guys "like me", as my friend John puts it, to sit and mentally participate in the policing process. This created an extremely pro-police citizenry, which one police chief was good enough to tell me continues to be the case to this day. I have to agree: When HCSO deputies establish a perimeter, call for air service, send in the dogs, and eventually 10-15 some thug who just knocked over a convenience store, my praise and respect for HCSO is no higher. I and thousands of people like me are your greatest cheerleaders when we can absorb that process for ourselves. If you block that venue, you mute that cheerleading squad. A step backward for one step taken forward in community policing. The idea that police business is police business is the antithesis of community policing, and you should be striving to think beyond that. Whether you think I'm some kind of nut or not, one thing is certain: You won't fight crime successfully without me and folks like me. That's a proven certainty.

Your philosophy exists outside your technical changes. There are things you can do to compensate for the door you are closing if you so choose. I will be highlighting some of these recommendations and suggestions in an upcoming documentary web page that will detail the Hillsborough trunked issue, and serve as a resource for police administrators and media hounds nationwide. For now, these suggestions include: Simulcasting of patrolcasts over local government channels, or even over the Internet. Simulcasting over the old VHF, UHF frequencies. You can even drop the policy of making the receive-only radios available to the "select" media. They are expensive, however, scanner nerds would saw off a limb to have them. I talked with a sergeant in Seattle this morning before tapping this letter. Apparently they have a "citizen access" program whereby anyone who wishes to purchase a radio may do so. The city will readily program them after the citizen has produced a valid ID, and has signed a waiver that he will not resell the radio. Seattle emphasizes my point. They have the same problems and concerns you do. However, their philosophy prompted them to go the extra step and resolve the public in some way. There is no such thing as a "select" media in Seattle, or Dallas, or Greensboro, NC.

I haven't forgotten about criminals. They are a problem and will always be a problem. But road deputies and police officers on the street are frequently dealing with opportunists and thrill-seekers. They are not of the caliber to make much use of police scanners to any significant extent. For that brand, I have no objection to the reasoned use of encryption. Indeed, going trunked generally introduces new and flexible encryption techniques as part of the upgrade. As a pro-technology buff, I say use them and use them aggressively!

I'm only talking about patrolcasting and it's an important distinguishment. When you exaggerate the security concerns, or huff about the fantasy cops that might appear at some crime scenes, you degrade the powerful social benefits that must be weighed in contrast. Most people know better than to put themselves in the middle of an unsecured and dangerous crime scene. Still others have a soul-bent obligation to help when help is too far away, such as was the case when two TPD were shot and lie helplessly dying in a pool of their own blood last year. An off-duty paramedic, listening to his cheap scanner radio in the classical sense of the scanner nerd (he certainly wasn't roaming free-lance for medical situations in which to assist), heard the call and bee-lined to the scene and quite literally saved their lives. The media accounts and the police appreciation awards that followed in the wake of this heroic action, makes the powerful point. We're all involved.

This letter is more for the record than action, but I hope you can see fit to consider these words while implementing your new system. I have an obligation per my beliefs to challenge the current system, because I believe I'm right, and paying attention to me will make your department an even better one than it is today. The scanner issue aside, there is a dire need to promote new and proactive ways for the police to communicate with the people they serve, particularly in this era of technology when excuses for not doing so are glaringly exposed as that: excuses. I mean no malice or hostility in all that I may report or suggest to whomever will listen from heron. I lament that I can only do so little.

When the documentary web page goes up in March, I invite your review and comments. It won't be viewed by the immense masses, but I am extremely interested in presenting your side of the story as accurately as possible anyway. As for the meantime...try not to let the Johns of the business excite you past the important fundamental that police work is public work. People "like me" are no different than people "like you".

> origin ....

These are LF/MF non-directional beacons, used for aircraft navigation.
The morse IDs are three letter identifiers loosely associated with the
name of the facility (airport or regional reference point), not
international callsigns. Frequency allocations in the US are 190-285,
325-435 and 510-525 kHz, tho' you'll find some in the 285-325 range also.

> Does anyone know of a list of these, what their exact location is ....

Stop by a fixed base operator at your local airport and buy a copy of
the IFR Enroute Low Altitude chart for your area ($3-$5). It will show
the location, frequency and identifier for all the beacons.

> Also below .2 mHz there are numerous odly modulated signals reminicent
> of LORAN. Does anyone know what these are?

LORAN-C uses 90-110 kHz.

Ron:
the Yaesu FT 8000 looks like a good candidate for what you want. Also some of the Standard radios are very wide-band receive, although the don't advertise them that way.
There are quite a few radios out there that have wide-band receive. Especially the handi-talkies.

Ramsey sells scamble decoders for about $25 and it works. I have seen
it demonstrated on phone calls in 46 mhz where all you hear is
srambled speech and with the flick of a switch......unscambled audio
!!!

I am not sure of the scheme that particular unscrambler works on but
for $25 it is worth the hours of fun. It really works though.

And then select "Frequency Guide."

Enjoy

1599. Scramble / Block Question

Newsgroup: rec.radio.scanner
Date: 1997-01-14 00:00:00 UTC
From: ramavich@umich.edu
Message-ID: <5beppm$svc@lastactionhero.rs.itd.umich.edu>
Source record: 211865

The local police are on an 800 Mhz trunked system,
but the extra twist is that about 95% of the transmissions
are scrambled or (more appropriately) blocked- when they
transmit you hear kind of a pulsing static or carrier-type
sound instead of the voice. Someone who seemed to know
their stuff called it TDMA.

I am wondering if anyone could explain how this works. I've
heard regular trunked systems before, and also ones which would
add a long tone to the end of each transmission (by the time
the tone ends your scanner will miss the next transmission, but
most likely will stop on the tone after it), but this is the first
I've hear of this system...

This also brings up another interesting question- How are
systems like this going to impact the future of scanning the
public services?? The new Uniden radio sounds like it could be
a big step forward, but can anything be done about these
scrambled or blocked systems like I mentioned above? When
trunked systems started catching on, I figured it would take
quite a while before they ever became widespread... but now....

thoughts?

> >The truth is starting to come out...seems the Gingrich call which was
> >ILLEGALLY intercepted and then ILLEGALLY recorded was given to a
> >Democratic Congressman who then turned it over to the New York Times.

The amount of misinformation coming out of this is amazing. So far today I've heard a Times reporter say she felt no laws were broken; the doofus who recorded the call said his cop friend told him it was okay to listen & tape cell calls, and doofus's lawyer state it's only been illegal to tape cell phone calls for "about a year". The media coverage of this unquestionably illegal chain of events has has been idiotic.

Worst of all, guess how sympatheic these bitten congressmen will be towards the scanning hobbyist next time the issue of blocking frequencies comes up.

Hey, come on. There's no need to call someone an idiot, just because they asked a naive question, i.e. will the new TrunkTracker "ignore" the data channel. We were all novices once. It's this kind of crap that gives newsgroups and other Internet services a bad reputation.

The computer interface in the SPECTRA does not loan itself to making
it a computer controlled scanner. That's what the control head is for.

In addition, the interface uses a proprietary protocol. If you don't
have a life and have a control head, you could figure it out........

Hi,

Usually around this time of year in ontario, I start to hear the snow plow guys in ontario talking...but this winter they are out and about, and the MTO freqs are quiet.

143.730
143.880
143.850
143.865
143.805
143.940
143.970
143.995
167.670
168.045

I went to http://www.interlog.com/~ronkatz/ont.html

and found some tower freqs, which I didn't know about, so I've entered them now too...but they seem pretty quiet as well.

Anyone else in ontario here, also listen to the snow plows, and if so, have you heard them this winter?

The part I didn't quote was a lengthy numbered list of anti-Democrat
slams. Sure it's important to discuss the issue of an illegal
intercept that may not be prosecuted. It is not as important for
individuals to flame the political parties IN THIS NEWSGROUP. There
are other forums for political diatribes. This ain't one of 'em.

I havent posted on this newsgroup before but am an a avid scanner
listener, One problem with this Newt situation is the fact that it has
raised the eyebrows of the lawmakers in Washington. This in return could
lead to more regulation of frequency monitoring. not good!

Reno herself? Probably nothing, considering it's not her job. It is the
job of the federal prosecutors, however, so you might want to ask them. Go
bug the parts of the DoJ that actually take cases to trial.

Just wondering if any one has any suggestions/thoughts on where to buy a new Bearcat now aday's. So if anyone has any companies they can reccommend (I have a friend looking to buy one soon) I am looking for the either 800 #s for the Catalogs or Websites if there are decent places to buy on-line. I am about to take a look at the Grove home page, so I don't need that one...

I have a hard time understanding why Opto just didn't write the software in the Xplorer (or Scout, for that matter), to just ignore the FM broadcast band. I mean, if someone really wants to pick this band up, they can do it with a $5 radio, I doubt anyone buys an $800 Xplorer cause they want FM stations, you know. It seem ludicrous that you'd need to buy a filter to get rid of the FM stuff. I mean, they block cellphones out of scanners without having to put a filter on the front end.

Hello everyone

Now you can find the greatest PocSag decoder wich you can use with your
SoundCard so you don't have to build a HardWare device for it.
You can download it on:

http://huizen.dds.nl/mkalmijn/

Now you can also register it. Pleace mail me the frequencies wich you are
using with the PocSag decoder (SemaSoft 512 baud).
Greetings,

Marco Kalmijn

1633. impotence solution --> new product --> read if you have problem

Newsgroup: rec.radio.scanner
Date: 1997-01-14 00:00:00 UTC
From: address@not.available
Message-ID: <32db0b45.0@lightning.ica.net>
Source record: 211899
Cross-posted to:
alt.test,rec.radio.noncomm,rec.radio.scanner,rec.radio.shortwave,rec.radio.swap,rec.railroad,rec.roller-coaster,rec.running

The purpose of this posting is to help educate people about
possible solutions for impotence problems and a new method
of treatment. Since this problem affects 30 million American
men alone this is a universal topic and therefore DOES
belong in this newsgroup despite any personal opposition
certain people might have. Thank you for your understanding
in this matter.

****
****
WARNING WARNING WARNING

If you are not 18 years of age or older you are not to
read this material.

This posting discusses adult topics, in particular the male problem
of impotence and possible solutions to this problem.

If you are offended by discussion of topics of a sexual nature you
are cautioned against reading any further.

WARNING WARNING WARNING
****
****

If you or your sexual partner experience impotence problems, either
occasionally or frequently, reading this short message may very well
change your life for the better. Even if you're just looking for some

extra "hardness" you will want to read this info.

After several years of research and development we are proud to
announce the availability of a totally new product to aid people with
impotence problems. It is called the "Hercules Erection Strap" and is
unlike any erection aid product you have ever seen for sale. It is
the most effective and most comfortable method of transforming partial
erections, weak erections, and early failure erections into rock hard
erections like you used to have.

How does this product work? Well, it assists in trapping the blood
within the penis (a natural function) by applying very firm yet
comfortable continuous pressure where you need it most - at the base
of the penis along the top edge and the both sides. The strap is worn
around the upper portion of the penis and around the waist and is
totally adjustable to any individual's penis size, weight, and

pressure preferences.

But don't make the very big mistake of thinking this is just another cock ring or other type of constriction device that blocks blood flow because it is not like those pain inducing devices. Unlike those, this strap does not completely block off the blood flow which makes it much more comfortable to wear because the pressure doesn't continue to build endlessly. It does not apply pressure to the bottom of the penis which would tend to block off ejaculation. The strap can also be used with a condom, plus it is lightweight, portable and fairly discreet. Its soft cotton and nylon construction make it infinitely more comfortable than some hard plastic or metal "cock ring" device. You and your partner will definitely appreciate the comfort.

This product was developed over a period of more than two years by a man who himself suffered from impotence problems. This individual tried every cock ring, erection cream and other erection aid known (except surgery) and wasn't satisfied with any of them - so he created his own solution. That creation was the prototype which eventually became the Hercules Erection Strap which is now available to the public exclusively through mail order at the present time. We strongly believe it is the best erection aid on the market and WE ARE WILLING TO GUARANTEE IT OR YOUR MONEY BACK.

You heard right, if you are not satisfied you can send it back for a full refund. No other erection aid on the market will make that guarantee.

But we do not claim that it will work for everyone in all cases and that is why we want to give you a money back guarantee. This way everyone can try it to see if it helps them without taking any financial risk.

We believe the strap will work for anyone who is capable of having at least some sort of erection, even if is only a weak erection for a very short period of time. The Hercules Erection Strap will help transform a weak erection for a short period of time into a strong one for a longer period of time.

However this product will not likely help those people who are incapable of producing any erection whatsoever at any time. Nothing short of surgery will probably help in those cases.

But the vast majority of people will see great benefits with this product. Once you try it you will never want to be without it again. Even those who usually have no problems either than occasional failure will want this strap for those times when failure occurs.

We are not asking you to pay for the product at this time. Instead, we would like to mail you more information about the Hercules Erection Strap that includes some diagrams which illustrate exactly how it works, why it is so superior to any other erection aid on the market, and more information about the probability of it working in your

individual situation. And remember we offer a full money back guarantee if you eventually choose to purchase the Hercules Erection Strap.

To help cover the cost of our postage and materials we ask that you send your name and mailing address along with $1 in either US or Canadian funds ($2 for overseas customers) to the address below:

DCI Company, Dept 1
P.O. Box 59141
RPO Westwood Mall
Mississauga, Ontario
Canada
L4T 4J1

Please note the postage rate for a letter from the USA to Canada can be up to 52 cents. Make sure you use enough postage.

All information will be mailed to you in a plain envelope with absolutely no clue as to the contents. We know this is a very sensitive issue and will always protect your privacy.

Thank you for your time and we look forward to helping you make an improvement in your life.

*** NOTE: WE DO NOT ACCEPT ANY E-MAIL REPLIES TO DISCOURAGE THE PRACTICE OF RUDE AND ABUSIVE "FLAMING". THAT IS WHY NO RETURN ADDRESS HAS BEEN PROVIDED. ALL THE INFORMATION YOU NEED WILL BE INCLUDED IN YOUR INFORMATION KIT.

Actually, yes, and no.

Many versions of speach inversion are keyed to the CTCSS, ie if the
CTCSS is 241.8, the inversion will be different from a user who has
his CTCSS of 100.0

MXCOMM, Transcrypt, and most others use this scheme.

Maybe. But this would be a better time to start lobbying for the repeal of an ineffective and unenforced law, don't you think? If we're very lucky, maybe we can get rid of ECPA and its redundant children and go back to the original Communications Act's non-disclosure provisions.

I think they'd get off on the CMS. Negligence is not an element of illegal wiretapping. If you can't prove intent, you can't convict. To answer #3, all criminal statutes have penalties on the books. In the case of ECPA, the penalties are a part of the statute.

>Could you get the latest band plans from the radio center tech?

I got some of it, but this guy is extremely tight with information. I'll have to ferret out the details for myself. I also heard last night, from a retired tech who checked into my Net, that fire and EMS calls are now being simulcast somewhere above 900 MHz (thus the packet-like noises on VHF) as part of a move to that band. I'll be looking for those freqs, too.

HAMFEST/COMPUTERFEST CALENDAR 1997 - NORTHERN ILLINOIS
last updated December 29, 1996

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale and ARRL for providing some of the information.

JANUARY 1997

Jan 5 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Jan 12 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Jan 12 (Sun), Waukesha, WI - 25th Annual Midwinter Swapfest. Waukesha County EXPO Center, Waukesha, WI. West Allis Radio Amateur Club (WARAC) 8:00 AM $3.00/$4.00. Amateur Exams. Ham Radio. Computer. Electronics. For Information Contact WARAC Swapfest, PO Box 1072, Milwaukee, WI, 53201 or Phil Gural, W9NAW, tel (414)425-3649.

Jan 19 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

Jan 26 (Sun) - Villa Park, IL - Wheaton Community Radio Amateurs Mid Winter Hamfest - '97 at the Odeum Exposition Center 1033 N. Villa Ave., Villa Park, IL. Doors open at 08:00 till 14:00

FEBRUARY 1997

Feb 2 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Feb 16 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Feb 16 (Sun), Rock Island, IL - Davenport ARC. Contact Don Schneider, WD0AMA, (310)-388-0108. email dschneir@saunix.sau.edu

Feb 23 (Sun) - Computer Central, College of DuPage (see notes at the end of this article).

MARCH 1997

Mar 2 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Mar 9 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Mar 9 (Sun) - Waukesha, WI. SEWFARS Swapfest. Waukesha County EXPO Center, Waukesha, WI 8:00 AM Talk-in on 146.820 pl 127.3 $4.00/$5.00 Ham Radio. Computers. Electronics. Amateur License Exams. For information Contact SEWFARS, PO Box 102, Delafield, WI 53018. 414-650-0724

March 23 (Sun): Grayslake, IL - LAMARS hamfest, Lake County fairgrounds. Admission $5 at gate, free parking. Setup at 6 AM, doors open at 8 AM. VEC testing. For Information contact LAMARSFEST, 650 Green Bay RD, Lake Bluff, IL 60044.

APRIL 1997

Apr 19 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Apr 20 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Apr 27 (Sun), Arthur, IL - Moultrie ARK. Contact Ralph Zancha, WC9V, tel (217)873-5287.

MAY 1997

May 3 (Sat), Cedarburg, WI - Ozaukee Radio Club Swapfest, 8:00 AM. Circle B Recreation Center, Intersection of HY 60 and Ozaukee Cty I. Talk-in on 146.37/97 and 146.52 $4.00 Amateur License exams. Amateur Radio. Computers. For Information Contact O.R.C. Swapfest Committee, W58 N985 Essex Dr, Cedarburg, WI 53012-1439 or call Gabe at 414-377-2784 between 6:00 and 8:00 PM.

May 18 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

JUNE 1997

Jun 1 (Sun), Princeton, IL. Bureau County Fairgrounds. Free parking. Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 Usually an excellent hamfest, with sellers from Illinois, Iowa, and Wisconsin.

Jun 8 (Sun) Six Meter Club of Chicago. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. Contact Joe Gutwein, WA9IRJ, (630)963-4922.

Jun 8 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Jun 22 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

JULY 1997

Jul 26 (Sat), Pecatonica, IL - Rockford Amateur Radio Assoc. (RARA) Amateur Radio and Computer Hamfest. Winnebago County Fairgrounds, about 15 minutes west of Rockford, Il. Talk in on 146.61 MHz, 114.8 Hz PL. This will be in the main exhibition hall with room for tables. Ham Radio Vendors, Computer parts vendors, tailgating, food. Code receiving contest, Throw the Radio contest, Great door prizes. For table reservations contact Mike Anderson at (815)397-4304 or mander5@ix3.ix.netcom.com. For any other information contact Marsha Plasters at (815) 399-9233 or wa9ffl@aol.com.

AUGUST 1997

Aug 16 (Sat), Franklin, WI - 7:00 AM, C.A.R.S. Crystal Ridge Ski Lodge. Talk-in on 442.200+ pl 100.0 / 146.52 simplex $4.00/$5.00 Radios. Computers. Electronics. Concessions. Door Prizes. Free parking. Free camping. Large Tailgate selling area. Electricity available, $1.00. Contact C.A.R.S., PO Box 325, Franksville, WI, 53126-0325. 414-325-7427

Aug 16 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Aug 24 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. Contact Bob Grosse, N9KXG. Info (voice/fax) (708)658-1678. http://www.angelfire.com/il/tcrg/

NOTES - Computer Central and Giant Computer shows

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

Giant Computer shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $5. Show hours are 9:30 AM

- 3 PM. To get on the mailing list or get more information,
call (708)974-3123.

Just curious, what made you decide on the CE-232 rather than the Opto board unit.
I am very close to buying one myself and would to know which is better. My key needs are auto logging and CTCSS decoding.
Please advise. Thanks.

Agreed Shiloe. That is exactly what will happen.

It is clear that the law has been broken. What is not clear is what is
congress going to do with the whole thing. If they allow these two to
get away with what they did, then we will all suffer. That would prove
the law to be ineffective, and it will need to be changed. Then it comes
to mind where is the line drawn? To prevent industry spys the business
band will have to be eliminated. Cordless phones and Cell phones will
stay gone. Police and Fire will have to be eliminated since avoiding the
police or fire dept during a crime can be done. I will not even
talk about the military bands. Everyone can see my point.

If these two are to pay a heavy price for breaking the law, the law would
prove to be effective. At that point, there is no need to change the

law. Personally I think that a heavy fine and jail time should be given as a punishment. For years we have known that it was breaking the law to share information on what was heard. An example would be police car 32 is at the cornner of 1st and 2nd street. NOT po-dunk police department uses 144.000 MHz. This leads me to my last two points. What you do in your own home or car is your business. Keep it your business and you will not get in trouble. You can monitor cell phone, police, fire, and a host of other things in your radio shack. No one will ever know. Bring it into public and you put yourself at risk. Even bragging at a scanner club meeting can be risky.

My last point is these two are a example of what scanning has become. Over the last 15 years I have seen this hobby change. Mostly for the worse. Years ago we use to share with each other frequency data, propigation reports, scanning styles (best way to monitor trunked systems), antennas, and other legal radio mods. Now when I look over this group I find mostly flames and some illeagal radio mods. A whole underground network of people that have lost respect for the hobby. Two of these moles came to the surface. Now I have the feeling that we all are going to suffer.

I am using a coupler I purchased years ago which has outputs for both vhf and uhf signals. It seems to work about as well as a mag mount mobile antenna.

I suspect that the matching network in the coupler might make the difference.

The unit I bought is probably no longer sold--I don't even remember the brand name--but I believe that there is at least one unit like it on the market.

If the truth were known, the conversation was most likely taped from a wiretap in Washington. The Florida couple just agreed to pose as the recorders, to allow an explanation of where the Democrats got it.

If there is no limter in line on the circuit board, then why does the external speaker not work properly when attached? Specifically, I get very low volume (almost unreadable) from the clip on speaker no matter what the level the volume control on the scanner is set at. I tested the speaker with another unit and it works perfectly.

I have the Radio Shack Cell Look alike scanner antenna. I looked at the wire, it says rg-58.. and I know the length is like 10-15 feet. I only own a 96 s-10 standard cab pickup, and there is ALOT of excess wire sitting behind the passenger seat. Would I benefit by cutting all the excess off? I own the Pro-2026 scanner...

Oh yeah.. I like to listen to the police and portable phones mostly.. would I benefit more by getting a scanner antenna more suited for this range. (police in my area are in the 150's...) The Radio Shack cell look-alike handles a big range of freq's.

I beg to differ -- I had an R-7000 for a few years (bought one of the first in the country after a 2 month wait!) It is a fine RECEIVER, but a poor scanner. Only 100 memories, slow scan speed, scan delay works differently than most scanners.

Of major frustration to me was a RF relay that "clicked" when you switched frequencies above or below 500MHz - this was maddening in a quiet room.

I added a really nice accessory to it which gave it shortwave capabilities and another 100 memories - so I had full coverage in one box.

But - as soon as I saw the AR8000 with its 1000 memories, computer interface, and alphanumeric display -- the R7000 was history! No regrets here.

Hi

I've been having a cleanout of my radio shack and have the following
items surplus to my needs:

AOR AR3000 Receiver: 100kHz to 2036 MHz continuous coverage, NFM, WFM,
AM, USB, LSB, CW modes, 400 memories, computer control. In
original carton. $NZ950

Eddystone 680X Receiver: 15 valve boatanchor, 480 kHz to 30 MHz in 5
bands,
with orignal speaker and service info. Recently overhauled. My
pride and joy a few years ago! $NZ350

JPS NF60 DSP Notch Filter: audio processor that will automatically
remove
hetrodynes and tones from an audio output. In original carton, with
Dick Smith plugpack powersupply. $NZ150

I'll pay freight within NZ.

I'm only interested in New Zealand enquiries unless you organise all the
exporting!

73's

Chris

The Following is from the APCO public safety communications bulletin
January 1997

Manassas,VA to install Motorola's 800 mhz, Digital system.

Manassas,Virgina Mayor Marvin L. Gillum has announced the city will
install a Motorola Astro 800 Mhz digital two way radio communications system.

the system will be used by the Police and fire departments, as well as the
electric department and public works.

Motorola designed and will install the new system,providing communications
infrastructure
mobiles,and radios.

to manage the communications traffic Motorola will install seven Centracom
gold series
elite consoles.

here is a summary of the rest of the article:
the system will be trunked and the system will incorporate a seperate 450 Mhz
19.2 kilobits MDT

this system is based on the apco 25 standard.

They will implement the system beginning of 1998

1685. BC 220XLT Help

Newsgroup: rec.radio.scanner
Date: 1997-01-15 00:00:00 UTC
From: wiggie@kansas.net
Message-ID: <853385390.5948@dejanews.com>
Source record: 211585
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I just picked up a mint condition BC 220xlt at the local pawn shop. It was in great shape with charger and earplug but no manual. I picked it up for $70 so I am not whining. I was able to figure out most of the basic stuff pretty quickly. I will probably just call and order the manual but it seems pretty close the the Radio Shack Pro-51 made by Uniden.
I was looking back through all of the posts on www.dejanews.com and found some posts asking about the keypad entries. My scanner seems to be new enough that it doesnt have the test frequencies in the cellular band, but what the hell, that is what my Pro-43 and Pro-2006 does best.

BATTERY/VOLTAGE CHECK
I did the WX and L/O on power up and got the little battery on the LCD with a number. I then pressed one of the number keys. I got the UP 1.75 now press WX and the down arrow and you will get the LO 1.50. Now press MAN! Now you get what looks like an interger value (a small "n" with some spaces and then the number "3" if you have it in the bank location 1). Banks 1,2,3 have "n 3", Bank 4 has "n 10", Bank 5 has "n 45", etc. These values can be changed by the UP/DOWN arrows. It gets pretty bogglesome.

Is any of this explained in the SERVICE MANUAL? Can you pick up the SERVICE MANUAL at the (800)297-1023 Uniden Parts number? E-mail or post any information please.

I have an earlier model of the GRE Superconverter hooked up to my backup scanner (Bearcat 210XL) here in the office. I use it to receive the LAFD on 800 MHz and it works very, very well.

>

The Sport 7 (or Sport 7x if one needs to be able to change frequencies). These radios' frequencies are between the GMS repeater output frequencies and the radios all have the capability to have one of six PL frequencies or carrier squelch. They are small and well designed.

Look at http://www.southernce.com/ for a good price on the radios and quite a bit of information. For the intended purposes of the FRS, the Sport 7 is ideal - the frequency (and PL frequency) will not change because someone "bumped" a knob and the price/size is small enough that one could keep one or two units in the car ready for use.

I have no connection with Motorola or Southern C&E.

Enjoy, Mac

Jim, I worked on Steve's capsule last year, and he does have
radios for communicating with other ships and aircraft, but
power is short and his major link is a Satcom antennae to
Inmarsat. He composes email on his laptop and transmits email
through the Inmarsat terminal back into the telephone system
and back to Loyola's web site in Chicago. I believe his
weather command post is in Omaha, Nebraska at SAC where his
weather expert is working the computers to determine what
altitude he should go to. Every hour his GPS position is auto-
matically sent out over Inmarsat to record his progress.

in my opinion, you should wait till the rs pro-51 goes on
sale again and buy it. it's not triple conversion if that's
important to you. but it's got a good range of frequencies,
200 channels (20 in 10 banks) plus 10 monitor channels.
great scanner for under 250. regularly 300, but when it
goes on sale, it's usually around 200.

If all the people involved in this scandal are not sent to prison for 5 years, then the law about monitoring cell phones is meaningless and would make monitoring legal for everyone.

>No. The Florida law only makes it illegal to INSTALL a scanner in a
>vehicle. That would exempt portable scanners. Also, another loophole

It does if the courts have given such an exemption. In NY, the courts have found no distinction between bolting a scanner to your dashboard and carrying it in your trunk in a box. Technically, it is illegal in New York State to take your newly purchased scanner home in your car, even if you haven't opened the box yet.

That isn't exactly what the court was ruling on at the time, but the ruling in question has that effect. People v Verdino (1974) 78 Misc 2d 719, 357 NYS2d 769 established that a scanner is "capable" of receiving police signals even if it is unplugged and turned off, therefore making it illegal to carry in a car.

>large enough to drive a Mack truck through in the Floirda law refers to
>monitoring frequencies allocated to police, etc., by the FCC. In other
>words, if these frequencies were not programmed in, the scaner would be
>legal.

Again, only if a judge reads it that way.

This is assuming you do not have a ham license.

This went around a few months ago, but these are the only ones I came up
with at that time:

Indiana.
New Jersey.
Kentucky.
Florida.
Michigan - permit available, but not easily.
New York.

Please let me know of any other states to include.

Thanx! --> Matt <matthewb@nishna.net>

BZZZZZZZT. WRONG. Typical unthinking knee-jerk reactionary response.
Louis Freeh has announced that an FBI investigation has been started
(he reports to Janet Reno, in case you did not know).

BTW, what ever happened to the people who intercepted Douglas Wilder
(Governor of Virginia) and then sold the tape to a radio station?

There is no basis so far for anguished claims of "double standards"
or "selective prosecution." Anyone who argues it is logically challenged.

Theoretically, the congressman and the staff of the New York Times
are just like anybody else in the eyes of the law. The former giving
the information to the latter is a crime, just like Joe Blow giving
it to John Doe.
In actual practice... well, we'll see.

Interesting that you think that... When the City of Miami trunked their operations back in 1984 (one of the first trunked public safety systems in the US) everyone said that...

Everyone insisted infact that since trunked communications had come of age there would be a year or two left of scanner listening and that would be it...

Well, I'm happy to report that it was just a few months ago that Metro Dade County Fl finally migrated to the trunked path and small cities like the one I live in are happy with their 3 analog conventional 800 freqs...

Yes there is a major push on the part of the industry to get people out of the stone ages, but economics are preventing these agencies from making the cut to the future...

In the US (not the case in Central and South America) most radio system owners try to get 20+ years of use out of a system... so there are plenty of people that are still online on all sorts of vintage 1980 and 1990 equipment... it may be 20 more years before a place like Broward County Fl decides it's time to upgrade their 2 year old analog trunked system... and this is a major metro... imagine a place like in the boonies of Alabama that has been operating with their 4 Ht-220's for the last 20 years... they don't need a reason to change.

Another thing that's worth mentioning is that with the addition of new Uniden trunked system scanner,
how long will it take for them to make a TDMA capable unit... 8 years or so...???

m> And how many off-the-shelf, this-year's-models of Radio Shack scanners
m> can *follow* a particular cell phone as at switches through multiple
m> cells, which the scanner itself is moving (and apparently without
m> dropouts or static for the length of the conversation, according to
m> recent news blurbs).

Since the person using the cellphone was a 'tourist', there's a very good chance that he was NOT moving, so the call would NOT have 'handed off' to another cell during the call. The fact that someone uses THAT excuse to try to show that it couldn't have been 'simple monitoring' just shows how LITTLE they know about cellphones.

>such action by the public?
>

The way the law works today, if you know something, regardless of how you find out about it and you DON'T tell the proper authorities, you're probably treading on thin ice and opening yourself up to a lawsuit. I know I'd much rather fight someone in court for disclosing something I heard on the scanner than having my ass sued off for not reporting something and something terrible happens to someone. Besides, I'd sleep a lot better knowing I tried to help someone else and prevented a crime from being committed or helping solve one.

Correct me if I'm wrong, but if someone calls an annonymous TIPS line with information, the police won't use it as direct evidence, but it may prove to be a missing link and point the police in the right direction to get the proper evidence.

> calls in 900 mhz.

In the U.S., cellular phone towers transmit in the 869.04-893.97 MHz range. A scanner may receive images of these frequencies in the low 900 MHz area, but this is a defect of the scanner, not the result of modification.

> As far as I know, the new 900 mhz phones are all digital and cannot be
> heard with a scanner (modified or not).

Cordless phones operating in the 902-928 MHz band may or may not be digital. At the moment, most of the ones in use are not. Note that these are cordless, not cellular (or PCS).

> Would someone please explain to me what is in that 900 mhz range and if
> there is something, how can it be heard.

They were convicted under the wireap laws (I don't recall if the
prosecution was federal or state) but the prosecutors specifically didn't
charge them under ECPA.

If all the criminals involved in this scandal are not spending 5 years in prison, then monitoring cell phones is legal and the laws are meaningless.

Body handling: 1 inline base64-encoded payload block was not displayed

Novatel 8301 modifications

Recycle old equipment, follow those instructions
to modify a Novatel 8301 mobile cellular telephone into
a cellular scanner...

1- Open the radio, remove the biggest cover (shield)
Once the clam shell box is open, the cover is the one
on the opposite side of the antenna connector
2- Remove the U30 Eprom and put it in the UV eraser
3- Jumper U23-10 to U23-12
4- Jumper U10-21 to U10-22
5- Jumper U7-37 to U15-4
6- Connect U15-4 to one side of a momentary push-button switch
7- Connect the other side to ground.
8- Connect a speaker to the RJ45 connector between pin 6 and 8.
9- Program your Eprom with the following program. It is in Motorola
S Record. Other Eprom like 27C64 or 27C128 can also be used.

Note: The program starts listening at 869 Mhz and stop at 895 Mhz.
The program will find an active channel automatically.
The switch is used to manually change channel.

Here is the scan.mos program:

8<--------------------Cut this
line-----------------------------------8<

[Inline base64-encoded payload not displayed]

8<--------------------Cut this
line-----------------------------------8<

My scanner is working fine. Please send your comments or questions
via Internet email to crac@enter-net.com

Good luck!

^^^

Correction, please:
These are not ADF's but NDB's (Non Directional Beacons).

ADF's (Automatic Direction Finders) are used (in an aircraft) to
find the direction (or bearing) to the NDB's. There were directional
beacons (notably the 'AN' beacons) but (in this country) exist today.

:
: Was there anything in the article that said what cellular system he was
: using? I cannot believe that a top American politician is still using an
: analogue cellphone. If he was using analogue, the twit deserves all he gets.
:
: If it was a digital system, it means the American police have routine access
: to digital cellphone decryption equipment.

The possibility exists that Gingrich was using a digital system but the
other party was using an analog phone, making any "security"that a
digital system offers useless.

The call could then easily be taped in Florida even if he is in D.C.

The same thing has happened here with a local politician. They were also
happily rebroadcast by the media who seem exempt from the penalties
prescribed to lesser mortals for such interception.

The program is a big waste of time and effort. I tried it a few evenings back and received nothing but gibberish, and it only "tries" to decode the gibberish when 512bps data is received. No matter what input level, and regardless of what the level indicator said, it still did not function.

I'll bet others are experiencing the same problems.

Whatever you choose, I'd suggest you purchase quickly. The Gingrich taping fiasco is going to result in all sorts of new restrictions on monitoring. By the time Butch, Bonior, Gephardt, and their friends in Congress get done screwing us with new anti-scanner laws, that little BC-200XLT will rank right up there with Puerto Rican heroin and Mexican Freon as some of the most sought-after contraband in the country.

RT> Now, since these folks have come out and bragged all about it in the
RT> media, I don't feel to cruel by saying "I hope they throw the book at
RT> them." Not because I want to see them punished, but I want to see them

I think the 'eavesdroppers' ONLY talked about it AFTR Sen. McDermott gave it to the N.Y. TImes. He's the one that needs to be prosecuted first. For the Disclosure. As an elected official, HE should certainly know better.

RT> 1) WRT the ECPA: It really can't be fairly enforced. About the only
RT> way the government will find violators of the ECPA, is if the listening
RT> is made public, as in this case, and chances are, unless the listener
RT> is really stupid, no-one is going to know unless the listener makes the
RT> communication public for some reason, such as to "blow the whistle".

I agree, but it IS still the law. I'd love to see it go to the S.C., and be overturned. So far, the only successful prosecution I know of under the ECPA has been against the Secret Service!

RT> 2) WRT non-disclosure: Remember the Pentagon Papers? What about blowing
RT> the whistle on a criminal action occuring at the company where you
RT> work and have a contract that says you must remain silent? The fact
RT> is, these folks *did* overhear something they suspected was criminal
RT> in nature. Let's change the situation a bit... If they had overheard
RT> someone discussing assasination plans for Clinton, Newt AND the Chief
RT> Justice, to take place at the inaguration, should they have remained
RT> silent then?

There's a HUGE difference between 'unethical' and 'illegal'. The people involved SHOULD have just kept this to themselves. I strongly suspect that they expected it to be kept private as far as their part, and that they'd get a BIG 'attaboy' from the Democratic Party. Too bad, didn't happen that way, but then, they SHOULD have realized that almost ANY politician would be more interested in publicity than in having a strategic 'behind-the-scenes' advantage.

RT> morning and no other FCC number would have been available.) The FCC
RT> agent agreed with my read of the law, that there was no escape clause
RT> in the radio act, and I probably couldn't legally report it.

So report it anonymously.

... Cannot the kingdom of salvation take me home?

>>Newt the newter got caught by real american citizens conducting what is consider okay for officials (corruption) but illegal for you and me. <<

Nothing Newt discussed in the conversation was illegal. However, the "real American citizens" committed at least 5 federal and/or state felonies by intercepting AND THEN recording AND THEN giving the recording to the news media.

The "real American citizens" should be in jail right now, along with US Rep Karen Thurman of Dunnellon, Florida who apparently told them they'd be immune to prosecution and helped them get to Washington DC to deliver the tape to another US Congressman.

Can anyone tell me what can be heard in the 900 mhz range with a scanner (modified or not modified)?

My cousin told me that a modified scanner will receive cellular phone calls in 900 mhz. However, I have been told that there is practically nothing that can be heard on the 900 mhz range and that 800 mhz is where all the cellular calls are heard.

As far as I know, the new 900 mhz phones are all digital and cannot be heard with a scanner (modified or not).

Would someone please explain to me what is in that 900 mhz range and if there is something, how can it be heard.

Thanks.

What, you think that's the ONLY reason I got a scanner? No way.
Effort? What effort does it take to turn on a scanner?

I listen to the "normal" stuff that scanner buffs listen to. I just
wanted to try something different.

>These criminals should also be prosecuted under the Florida Statutes
>because mobile use of a scanner is illegal in Florida unless you have a
>ham license.

No. The Florida law only makes it illegal to INSTALL a scanner in a vehicle. That would exempt portable scanners. Also, another loophole large enough to drive a Mack truck through in the Floirda law refers to monitoring frequencies allocated to police, etc., by the FCC. In other words, if these frequencies were not programmed in, the scaner would be legal.

If these clowns get off based on the above-mentioned exemptions, however, look for the Florida legislature to immediately tighten the laws. That's the downside here :-(

Due to its conversion setup(very high 1st IF), images for cellular
frequencies are VERY sparse. Unlikely you'll be able to easily mod
it to pick them up directly either.

>
>Thanks.

It sounds like you have been told some misconceptions based on ingorance
rather than fact. There are some separate issues to sort out:

Cellular phones are between 869 and 896 Mhz.
900 MHz cordless phones are between 902 and 920 MHz.

Not all 900 MHz phones are digital, but most are. Some use digital spread
spectrum, some use conventional channelling. Some are analog voice and can
be heard on your scanner. I have a neighbor who uses an anolog 900 MHz
cordless phone, I can hear that phone just fine.

Some scanners hear IF "images" of cellular phones in the 900 MHz range,
and others hear cellular images in the 300-400 MHz range. They can show up
just about anywhere, depending on the scanner's IF frequencies, filtering,
etc. My Pro-26 heard cellular loud and clear above 900 MHz, right on top
of 900 MHz cordless phones, for instance.

Many consumer wireless devices also operate in the 902 to 928 MHz band,
including wireless speakers, headphones, TV/VCR wireless transmitters,
etc. It's all crammed into the band on a supposed "non-interference"
basis, which doesn't work real well in reality. If you live in a large
apartment building, these devices will wreak havoc on each other no doubt.

Hope that helps answer your questions.

Happy scanning!

>Does anyone know what variety of scanner was used to pick up
>Gingrich, et al.?

Another silly but relevent question.

I have not read the transcript but are both parties of the conversation
on the tape?

If so, how did the eavedroppers record both sides of a CELL phone
conversation with one cheap Radio Shack scanner? I would suspect that
either they picked up a cordless phone or something far more devious
occurred. With one of those R/S scanners, the only way to pick up both
parties a cell phone conversation would be if one of the wired parties
had a really cheap phone or speakerphone with a lot of bleed and I think
that is very rare.

In your particular case, informing the police that you saw a
vehicle/person
they were looking for does not break any laws. You have not divulged the
information you heard to a third party. You should have even less to
worry about because, I believe, it states the information shall not be
divulged to any person/agency other than sender or intended receiver.
Telling your local police about their own radio transmission is not a
problem. So I guess that would mean if you told a local cop about a
state police transmission, then you are breaking the law! ;-)

If you repeat what is said, in any sense, what you heard, then you are
"breaking the law".

I have read lots of reports where people taped cordless/cellular phone
calls(drug deals, plotting murder) and turned the tape over to cops who
did their thing; they could care less how you got the tape. Of course,
the wise individual, makes an anonymous mailing/drop-off of the tape to
ensure condifentiality. Either way, the tape is still "illegal" and is
not admissable in a court of law. It's up to cops to use it as a
starting point to gather their own "probable cause" information. And
in today's world, they will be grateful for any help you give them.

From: tosca@cts.com
Message-ID: <32DD1EA9.35A6@cts.com>
Source record: 211648

I have read alot of the NEWT stuff and here is the scoop:

1)Yes a cell phone call can be followed with a $400.00 DDI and a scanner.

2)The reason they were able to monitor the whole call was that maybe the party with the cell phone was NOT moving!

3)A cell-phone call is NOT hard to find late in the evening when traffic is low on the 832 available channels, and even easier if you know which carrier somebody is using i.e. A side or B side.

4) These people who intercepted the call are "board certified stupid" and should be indicted in Federal Court for violation of the 1986 ECPA, among other things.

5) If the "Butch Reno" does not prosecute these idiot savants, then they should repqel the law anyway, since law enforcement officers routinely monitor cell calls w/ commercially available equipment. Remember Simpsons cell phone calls that were monitored by LAPD? By the way, why aren't the LAPD cops who monitored Simpsons cell calls without a warrant in jail?????

The LAPD had the full cooperation of the cellular provider. They
don't get that without a warrant. Also, most reports about the LAPD
use of cell phone technology was to track the location of the phone,
not to monitor the calls. The actual content of a cell call that was
quoted came from a call that Simpson made TO THE POLICE.

They would be appropriate if phrased in a less emotionally and
politically charged manner. We're all curious to know what the
Department of Justice are going to do about the felonies involved.
The Attorney General will probably take no action herself because it's
not her job. That's what the FBI is for.

ScannerWorld has them advertised on their page www.scannerworld.com.
Their number is 800-476-7640 the part number for their battery is BP2500.
The cost is $32.99. I'm not affiliated with them in any way. I just have the same scanner and am having the same battery failure problem and found them here.
I haven't ordered one yet.

>
> Hi,
> If money is not an object what is the cream of the crop for scanners?

For base units :
Watkins-Johnson sells some receivers in the $10,000 to
$15,000 range. Icom has the IC-9000 for about $6000.
The new AOR AR5000 and Icom IC-8500 run around $2000.
The AOR AR3000 sells for about $1000 these days. The
Pro-2042 sells for $370 or so while the Uniden
BC9000XLT runs around $350.

For handhelds:
New from Yupiteru is the MVT-9000 which is going for
$700. AOR's AR8000 is about $550. New from Icom is the
R-10 which should be in the $500-$600 range. The Uniden
BC3000XLT and Radio Shack Pro-26 sell for $350.

There are lots more priced under those listed above. So
there's something for everyone no matter what your budget
is!

>any charges. A perfect example of the "selective prosecution" invoked by
>that agency.

No Drew. In the context that these "What's Butch gonna do?" are used, it is very apparent that the posters of most of those comments are making their statement for political discussion and not WRT to hobby.

Go back and read many of them, and you see "Democrat", "Republican" and "hypocrite" used more often than not. If you want to discuss the case WRT to politics, take it to talk.politics. If you want to discuss it WRT the hobby, do it here.

As far as the justice department not filing any charges yet, keep in mind that the clock starts ticking the instant they file the charges. Any investigation they do prior to filing charges, is extra time they have to make a strong case... Ward and June don't appear to be the fleeing type, and if the Justice Department takes advantage of a slower clock at the moment (What is it, three years before they need to file?) then they have more time to create a stronger case. What advantage do you see to charging them at this very instant?

And, if you insist on talking politics here, then answer this... "Why hasn't the Republicans filed charges against Clinton yet?"

Please, lets keep politics out of this newsgroup. I can get that shit in virtually any other newsgroup... why pollute this group too? If you do decide that it is your right to keep this bullshit discussion going on in the political direction, that is your ultimate right, but I will probably be killfiling anyone who continues in this direction after a few days... I subscribed to this newsgroup to read and discuss scanning.

> tom@bbs.galilei.com
> http://www.geocities.com/capecanaveral/9530

Tom,
The basic difference between the 29 and 66 is the addition
of VHF-air to to the 29. The 29 also has the global scan
delay while the 66 is selectable per channel. The 66 also
has 20 search pass frequencies. If Radio Shack still has
the Pro-51 on sale, I would pick that up instead. If you
want either of these radios, buying through mail can save
you $50 bucks or so.
If you can afford the $200 or so, you should check out
the BC220/230XLTs which provide more channels and features
than either the 29 or 66. The BC200 is running $200 if you
can still find one while the BC230s are in the $210 to
$220 range. The drawback, IMHO, is that Uniden scanners
force you to use ni-cads while the Radio Shack line gives
you the option of using alkaline or ni-cad AAs.
Triple and double conversion refers to the circuitry
that the radio uses to receive radio signals. Triple is

more expensive than double and provides a greater degree
of freeedom from various sorts of external and internal
interference.
As for the ni-cad back you mentioned, it is not designed
for either the Pro-29 or 66.

You got a problem with handguns pinhead? You even know what an "assault weapon" is bozo? These idiots are obviously a couple of left wing activists trying to dig up dirt on the GOP. Now they're acting so "sweet and innocent" as if they were just trying to "do the right thing". What they did was the equivelent of an illegal wiretap. How would you like transcripts of your cordless conversations on the front page? Monitoring the call was illegal, ok so we all listen... But recording it and publicizing it, come on that was no accident! I think you've been into the MARYJANE yourself, dopehead. Lastly, you don't have the constitutional right to keep and bear a radio receiver as we all have the gaurenteed right, as Americans, to arm ourselves, regardless of the label you attach to the gun! Maybe they were using an ASSAULT SCANNER.

Wasn't Janet Reno the AG in Florida? And the people that taped it are deeply involved in the Democratic party in Florida. Lets think, Janet is now the USAG, and has all the snooping assets of the FBI at her disposal.

Get a couple of cronies in the old home state to do some dirty work with some borrowed equipment, and act stupid on TV when questioned about it. Conspiracy? Good question.

Erin

Obviously posted by a technically-challenged mind. The signal transmitted
by the base unit has both sides of the telephone conversation. You should
show your ignorance by making clearly incorrect statements.

Modified? Do you know it was modified? It could simply be a couple
years old.....

The tape recorder part seems a little strange, but many scanner users
do keep a recorder handy.

John,
If you have an older Pro-51(date coded 7A4 or earlier), then there is
a keypad trick used to trick it into the cellular range. There is no
mod to pick up the 25-30MHz range.
You can also buy a radio manufactured shortly before the ban that
can be modified to receive the restricted regions. Or order models of
recent radios from European/Canadian importers where such restrictions
do not exist.
To pick up the 25-30MHz range, you'll typically need to buy a
higher end radio such as the Pro-26 or BC3000. Both of these can be
purchased as non-cellular-blocked versions.

I'm thinking about putting up an external antenna and have problems like most folks living in track homes. But I was wondering if I couldn't just mount the antenna in the attic? I'm looking at one that Radio Shack has (about 6" in height) and I've had success with it before. Sales for about $35.00. What affect if any would I notice by placing the antenna in the attic. House has vinyl siding and wood frame, single story, slab.

Here's another blatant example how apologists for the Democrats like the clown above (and the left in general) believe that ANY means, ANY crime, ANY lie or wrongdoing justifies their political aims and views.

He thinks criminal activity should be praised, just like Clinton, Reno and the whole corrupt bunch in the White House praise their criminal cronies.

The liberal left can be deftly described as "A finite, limited thinking ability developed to it's fullest capability".

>The catalog number for the 8U was the same as the 8M.
> Fred

Fred,
The big problem I see with your data is that your loss data stops at 400MHz.
At 800MHz or above, RG6 knocks the socks off RG8 or RG8x or RG58. As the Freq.
goes up the loss does also, and at the higher freq's you need all the signal
you can get. Spend the little extra and get the RG6. But then if you really
use a Radio Shack catalog for your cable specs.... maybe the RG8 is good
enough...

Thomas M. Sommers <tom@runpmx.rutgers.edu> wrote:
>
>It is the original act that the interceptors and whoever they passed
>their tape to, including the Times, violated.

They violated BOTH the act of 1934 non-disclosure, and the ECPA... as well as the state law about having a scanner in a car.

Now, since these folks have come out and bragged all about it in the media, I don't feel to cruel by saying "I hope they throw the book at them." Not because I want to see them punished, but I want to see them charged with more than the older non-disclosure violation. I want to see the government try to prosecute under the ECPA, and get this stupid unenforcable law before the Supreme Court.

I really don't care if it was a Republican or Democrat harmed by the "evesdropping", as I don't see any real difference between them under the frosting anyway, and frankly, I don't think the "What's Butch gonna do now" comments are appropriate to this newsgroup... if you want to discuss politics, take it to talk.politics, and let the scanner groups discuss the effects of this "violation" on the hobby.

Now, IANAL, but I have some comments on this whole thing...

1) WRT the ECPA: It really can't be fairly enforced. About the only way the government will find violators of the ECPA, is if the listening is made public, as in this case, and chances are, unless the listener is really stupid, no-one is going to know unless the listener makes the communication public for some reason, such as to "blow the whistle". (See next comment)

2) WRT non-disclosure: Remember the Pentagon Papers? What about blowing the whistle on a criminal action occuring at the company where you work and have a contract that says you must remain silent? The fact is, these folks *did* overhear something they suspected was criminal in nature. Let's change the situation a bit... If they had overheard someone discussing assasination plans for Clinton, Newt AND the Chief Justice, to take place at the inaguration, should they have remained silent then?

IMO, even talking about prosecuting the couple for blowing the whistle, doesn't make me look up to the men and women who we have placed in positions to guide this country. IMO, it's not any better than the California official who had a Texas resident arrested for suggesting that the official be hunted down and mounted, just like

the animals he hunts.

There is a case which IMO is similar in nature, which, while currently still in a US District court, will no doubt make its way up to the Supreme Court when it is done. The case I am thinking about has its roots set in Usenet, and is about one person's right to turn over "Trade Secret" information he is in possesion of, over to the FDA because he claims that the "Trade Secret" information is in reality, a manual on committing a medical crime. The owner of the "Trade Secret" material claims that he cannot turn over such information, because... it is a trade secret. Currently, a court issued restraining order keeps him from turning over said information to the proper authorities.

Here's another story. Back in 1988, I overheard a series of radio comms in the hi-vhf business band. I heard what was quite obviously a stake-out by persons unknown, of a location I was able to ascertain just by observing the vehicle traffic being discussed on the stake-out comms.

[NOTE: All this occured line-of-sight from my radio room window. Do not EVER venture out and try to find a stakeout you are hearing.]

I observed these communications for three evenings in a row... and then it was all over... the channel was silent of their traffic... About two hours later, I heard a police dispatch on my scanner about a man tied up on the corner of the restuarant two blocks away, that was being staked out. Putting one and one together to make two, I decided that this was the outcome of the "stakeout" which I had heard earlier.

Should I have called the cops? I knew the law, and it was clear that reporting what I heard would be a violation of the radio act. Just to make sure that there wasn't some escape clause, I called the FCC Field Monitoring Station down in Livermore (It was after midnight on a Sunday morning and no other FCC number would have been available.) The FCC agent agreed with my read of the law, that there was no escape clause in the radio act, and I probably couldn't legally report it.

Newt the newter got caught by real american citizens conducting what is consider okay for officials (corruption) but illegal for you and me. Its funny how hard both partys worked to out law scanning cell. But not a peep about banning hand guns or even a real assualt weapons ban. Scanning is like the internet the common Real citizens way of grabing the bull (big brother or little brother local keystone cops) by the horns. Goverments are terrified for the people and the media to know the truth about heir real activities. Scanning is as american as the constitution itself. The right of the people to keep at least both eyes on the public servant as well as the criminals. It was a video camera in the case of rodney king, now a simple radio receiver. Wow you'd think the red army had come to roohst. Maryjane approved by overwhelming margins in 3 states for medical purposes....NO the goverment knows best even though the people spoke. I personally was scaninng several years ago when I found the local sheriff on an oddd channel telling of how to frame his opponent in an upcoming election with a dwi that night. I was not the only one, the media caught it too. The people found out they had a real dog for law enforcement....he was soundly defeated even after his opponent was charged with dwi. It was later droped. One things for certain if you want to see a fat dope gomer speaker of the house actually move faster than a snail just turn up the the volume of your scanner in his presents.

Since the politicians will no doubt decide that Something Must Be
Done, the best bet is to try to push them in the direction of
something useful (e.g. repealing crypto-export laws and other barriers
to routine encryption of cell phone and similar communications)
or at least something harmless (e.g. requiring warning labels on
cell phones). Once they do _something_, they'll consider the problem
solved and forget about the issue again.

a1a00051@bctel.ca wrote:

>I saw a used Yupiteru MVT7100 the other day for about
>$300US. Is this a good scanning receiver?

Some advantages:
- Short "squelch tail".
- Very wide coverage.
- Good shortwave band reception for a scanner.

Some disadvantages:
- Does not have 15 khz steps, so I had to program all of the police &
fire freq's into the memory channels, as 5 search khz is too small.
(My unit is not the "USA version".)
- MW does not have a ferrite bar antenna, I think MVT-7200 does.
